Our Commodore Surgery - dealing with a host of your problems

New ways to plot

Datafax has announced a neremarkably low £180. But can you use it with your Commodore computer? The answer, as usual, is that you'll need an interface adaptor, as the Sakata SCP-800, as it's ponderously called, has only a Centronics parallel interface. A fairly cheap adaptor may suffice because you'll probably get away with buying a cheap adaptor since you won't be able to produce Commodore's Commodore 1520 (reviewed this issue) can do that. Still, the price and facilities look like making it a better buy than the 1820.

The Sakata can use paper up to Ak in size, both single-sheet and fed from a roll. It uses 4 colour ball-pens (identical to the ISO's) and, like the ISO, has a range of four character sizes for primiting. Print speed for the smallest size is 12 characters per second, deteriorating to 6 per second, deteriorating to 6 per second for the largest.

The plot mechanism is done on an x - y basis with a speed of 57 mm per second across both axes and 81 mm per second across both axes and 81 mm per second travelling diagonally. Accuracy of movement is 0.3 mm maximum. Datafax claims that felt-tip pens will soon be available to allow for overhead projection. Also being developed is screen-dump software for the Commodore 64. More details on 0258 648187.

Commodore goes Top of the Form

It's no secret that one of Commodore's ambitions is to make an increasingly large impact on computing in British schools, where the BEC micro still has a virtual monopoly. As part of its "defucionan of fleesive" for next year, Commodore bas amounced that it is to sponsor the 1988 British Computer Society's Computer Quiz.

Similar to TV's Top of the Form programme, the quiz invites schools to produce a team of three children by November (one under 17, one under 18 and a third under 18 years of age) to enter regional heats in which a quiz master bombards seach team of boffins with a series of group and individual queetions (no

conferring, please).
Forty branch finalists go on to
compete in eight regional finals
who in turn go on to the national
final, scheduled for July of next

The Sakata SCP-800 Colour Pi year. Schools will be invited to host rounds of the quiz on their own premises.

What about the prizes? Branch winners will receive a Commodore 64 modem, regional finalists get a Commodore 64 and disk drive each, and the overall winning school will receive \$1,000 worth of Commodore computers and peripherals. If the competition doesn't what

schools appetites for Commodore computers, in Commodore or morpiters, in Landware loss and apposite shall scheme, and that's open whether you take part in the spill or not. Schools are offered free ⁵⁴ yeares on a three-month loan basis, the deep how the spill supported or a three-month loan basis, the deep how the supported free every \$7 raised by the school, Commodore matches it with \$3 - sounds like a good idea, More details on 01-\$37 O471.

Clubbing it for repairs

A new organisation, the Micro Repair Club, has been set up to offer a Repair Package to home computer users when their manufacturer's warranty runs out for Commodore 64 and Vic-20 owners, that means after one

It's quite a simple scheme (surprising it wasn't thought up earlier); you pay an annual subscription fee which quarantees free breakdown repair for your computer. Prices are 524.85 for the first year, with a subsequent renewal fee of £14.95. A four-year cover package deal would cost you

So how does it work? The Club itself merely acts as the middleman between an insurance company (Domestic and General

Insurance) and a repair company. To aimply package up your ailing micro and send it to Computerate, an independent maintenance company belonging to Thorn EM. That company understikes to do repairs free of charge within a week. —but there are no written guarantees. If the company can maintain this level of service, users may find it an attractive alternative to paid repairs done by Commodore inself, which aims to return goods.

within two weeks. At present, you cannot claim free regains for breakdown caused by accidental damage. Only breakdown caused by accidental damage. Only breakdown caused by fastly mechanical or electrical parts is covered. The Chair special parts is covered. The Chair special parts is covered. The Chair special parts in covered to the supplementary policy to cover accidental damage, the sud their special parts and their special parts and deleasents of the cover to purplemental tilto printers.

MRC is not surprisingly eager to push its service in schools, a particularly fertile area for micros, offering a deal of £24.95 per year for the first machine and £19.85 each year for the rest

Computer retailers are also being encouraged to offer the service to buyers on a commission basis. According to Simon Jamisson, MRCV general manager, offering membership is another selling point that is bound to sway the potential bound to sway the potential computer of the point of the first year, why look elsewhere for a repair service? More detail from MRC on 1946 TZT.

Orbitron, Squirm, Duck Shoot and Vegas Jackpot, not forgetting their latest offering, Chiller, As consolation for the tape-bound. games will feature its "burner I sading" fast loader

SHORTS

Basic on video: Most people teach themselves programming with a book. But since we're in the Video Age, it's not surprising that a company should come along with a tutorial videotape. with a range called Masterclass Two tapes are available (for both Vic and 64) which take you from the first steps, to advanced programming in Basic. Each tape includes examples of Basic programs on its audio track which you can load into your machine (through a somewhat tortuous route). The tapes cost £19.95 each and are available in both VHS and Betamax forma More details on 061 437 0538

CHRISTMAS S

THE CHEETAH RAT

Look Mum no wires – a new remote control joystick for the Vic and 64 will relegate traditional joysticks to their rightful place in the Science Museum say its manufacturers – Cheetah Marketing.

The Rat is an infra-red action transmitter that works in conjunction with a receiver that plugs into the control port two receiver at the side of the 64. This has been styled in the same colours as the 64 to make the whole thing look neat.

The joystick itself uses a disk controller for direction and is also capable of rapid fire. It requires a PP3 battery and will fit easily into the palm of your hand.

Cheetah claim that the Rat is the fastest controller yet produced for the 64. It can be used up to thirty feet away and has the advantage of letting the player play the game at a good safe distance from the screen.

The Rat is compatible with all existing Commodore software and can also be made to work with your own programs.

You can purchase the Rat from specialist computer shops at £29.95. This could make a good present from mothers who are fed up with joystick leads worming their way around the living room.

Christmas time is present time and for many a computer owner that means receiving a useless peripheral that is totally incompatible with your system.

Worse still are the smaller gifts of software packages that you have either already got or do not want.

To give you some idea of the more interesting add-ons and software packages we have drawn up a list.

To get the best results from our Xmas shopping list leave your Commodore User open at this page on the coffee table.

Better still read it in front of your target and occasionally mutter something like "Hmm thats interesting", or "thats useful"—if they still don't get the hint you may as well just come right out and say "I wouldn't be too upset if someone bought me one of these for Christmas".

PRINT 'N' PLOTTER ADVENTURE PLANNER

Adventure freaks can now make use of a clever adventure solving aid to help them work their way out of the stickiest of situations.

One of the most difficult parts of adventuring is trying to work out where you are at any given time.

Its all very well being a great lateral thinker and solving problems instantly. But if you don't know where the problem is taking you in relation to where you have just been then you are as lost as the next person.

Dungeon-scarred adventurers have long been aware of this problem and have mapped their every move on

HOPPINGLIST

TOUCHMASTER FAMILY FUN

The Touchmaster is the latest of the direct-entry devices launched for the 64 that enables you to put graphics on-screen without using the keyboard.

Prutec, the company behind Touchmaster believe that many people are put off using their computer because of a resistance to the keyboard. This belief is backed up by a great deal of research currently being conducted in Japan. America, and the UK into the so-called "fifth generation" of computers which will use speech and touch to communicate with the computer.

Touchmaster has a pressure sensitive A4 work surface and a resolution of 256 x 256. There are no moving switches or dials - graphics are simply painted on screen using the software package and overlay that comes in the box.

Prutec believe the Touchmaster will have many applications outside the home "Commercial and industrial applications for this technology only await the software."

Touchmaster will have its own range of software specially written to run with the system. The first of these will be graphics packages enabling the user to create designs using preprogrammed shapes, board games, arcade games, and adventure games and utilities such as sound synthesisers and graphics editors.

It's likely that the best immediate application of Touchmaster will be in education - particularly for pre-school age children who will benefit from bright overlays and specially written software.

Touchmaster is just one of a number of graphics tablets currently on sale. It is on sale at a slight pricey £149.95. Other similar graphics tablets are the

Super Sketch from Stonechip, Grafpad from British Micro, and Koala Pad from Audiogenic.

Touchmaster - making the computer more accessable

graph paper. Every book on adventure includes the obligatory chapter on mapping.

The Print 'n' Plotter Adventure Planner comprises fifty pages of A3 that's Daily Mirror size - to plan, and

keep a permanent record of the game so far to avoid repeating mistakes and following paths that you have already discovered lead to nowhere.

Each of the fifty pages contains a mapping system with over 150 locations and comes complete with examples and hints and tips on the art of mapping.

The Planner can also be used by people who prefer to write their own adventures to pre-plan the locations.

The Planner is available from specialist computer shops at £3.95 or by mail order at £4.50 inclusive from Print 'n' Plotter Products Ltd, 19 Borough High Street. London, SE1 9SE

CHRISTMAS SHOPPING LIST

COMMODORE'S MAKING MUSIC

The Christmas tradition of all the family sitting around the piano singing festive songs is about to get a computerised boost thanks to the latest

add-on from Commodore for the 64. You can now sit your family around the 64 and let the computer's three sound channels produce the melodies.

The Music Maker consists of software, a twenty-eight page book of popular songs and tutorial material and a 24 key piano-style keyboard which fits over the 64's keyboard.

The software has eight built-in voices which simulate instruments such as the guitar, piano and synthesizer but all the parameters of each sound can be altered to create almost any sound within the capability of the Commodore 64.

A number of different modes can be selected from the menu including one which creates a range of rhythms from Waltzes to disco, with preprogrammed bass patterns, around which a tune can be created.

For the complete novice tunes can be copied out of the book into the computer. These can then be played back from memory reproducing the key strokes on screen as the tune plays.

Commodore are confident that the Music Maker's £29.95 price tag will make a real winner in the Christmas present market. "The combination of keyboard, software and book will unleash the full music potential of the Commodore 64 for the first time" says the sales blurb.

OLD FOGEYS

Old fogeys have been having a lean time of it recently with all the publicity going to their younger counterparts. Commodore are determined to

redress this balance and have signed up two leading old fogeys to promote their new graphics software utilities. Tony Hart, old fogey extrordinaire,

and presenter of the BBC's 'Vision On' and Take Hart' endorses the new Art

Master package. "I was impressed by Artmaster because you don't have to be a computer expert to produce pictures".

Old fogey number two, Rolf Harris, beams out from the box of the Picture Builder which is aimed at a younger age group than the Tony Hart package. The picture builder enables the user to build on existing graphic characters

The utilities are available on disk or stored in software. cassette at £11.99. Could make a good present for old fogey lovers

everywhere.

The silly book business is one of the few booming areas of British publishing, having spawned a host of best-sellers in the last few years.

Not surprisingly the computer book publishers are now jumping on this bandwagon. Well, when you've published a hundred books on the 64 disk drive you kind of run out of things to sav about it.

First of the loony computer books is Computer Wimp by John Bear which contains essential information on "computerbabble" - or how to talk to computer people and "Why you need never learn programming". A giggle at

Even more looney is the recently published 101 Things To Do With A Dead Computer – suggestions range from yanking the keys out and using it to make ice, growing plants in it, or using it to grate cheese. A few cartoon laughs at £1.95 - more of a stockingfiller than a main present.

Unterview

Opportunity Knocks.

This is your big chance – the top programmer's job. All you have to do is be at the right place at the right time.

But don't be deceived, the competition is tough out there!

Due to the complexity of its outstanding graphics and challenging game play, interview is a multi-

BLOGNITE YOUR OWN TER

Are 'games designer' programs all they're made out to be?

Sooner or later, most Basic programmers are going to try their hand at writing a game. Why not - they've all done it, why can't you? But for the less than obsessive enthusiast, that's a tall order. So a games designer package like Scope, The Quill or Mirrorsoft's Games Creator might be an attractive answer, especially if it let's you of learning machine code. Roger Jones, himself a professional programmer, looks at all three and finds out whether they'll help him make a million - or at least a few bob.

by Roger Jones

Games designers (all into two main groups, adventure and arcade, but the arcade designers have to be split into two subcategories, re-designers and pseudo-assemblers. In this article I am going to take an example of each of these and compare their merits and disadvantages.

Scope for design

Taking the last type first, one of the best pseudo-assemblers currently available for the Commodore 64 is Scope from Codewriter Limited. Scope is an entirely new language dedicated solely to the purpose of games writing. It enables you to construct machine code routines

construct machine code routines (or at least something like them) which can be run from within a Basic program. It uses Basic-like commands to write the routines and then compiles them into its machine code.

Scope comes in a nice presentation box complete with a comprehensive and fairly easy to read manual which takes you step by step through the 46 command words which make up its language. These command words have to be entered in basic REM statements and the completed Scope routine is then compiled into an area of high memory reserved for it by the main program. Completed routines can be saved to tape for later use with the tapesave program included with the package.

Scope is intended for the rapid execution of sub-routines in a Basic program and as such can handle graphics, sprites, colour,

The Quill - most successful games designer.

sound effects, music and animation but herein lies its weakness as a 'designer'. It is not the sort of thing that a programmer with only a smattering of Basic could hope to pick up and create those ehusive

moneymakers with straight away.
In use Scope is a complicate
as Basic and a good knowledge
of program structure is necessary
before any results can be
achieved. There is no provision
for multi-statement lines so
latings tend to be very long and
narrow and the inseminable
narrow and the inseminable
mumber is tedious to say the
least. The demonstration
programs included on the

programs included on the reverse of the tape show some of the capabilities of this undoubtedly powerful language, but that is what it is, a language, and it's not that easy to learn. At \$17.95 it is neither chean.

nor, for what it is, expensive.
When I have more time maybe
I will learn to speak Scope, but
then I might just as well learn
machine code itself?

Mirrorsoft's Games Creator

Sicking with arcade designers for the moment, the other subcase gony is the re-designer. There have been a number of home-produced re-designers around for some time for the Spectrum which allow you to chop let Set Willie and company to bits and put them back together in a different shape. Now from Mirrorsoft comes Games Creater for the Review

Commodore 64. If only that was what it was. When I first heard about it, I thought my quest for a way to write that blockbusting arcade game was at an end, but

oh dear me, it was not to be. For all that, though, Games Creator is still a very good program in its own right. More pretty packaging contains the manual and single tape, which is a sast loader. The manual is written, I feel, to appeal to younger enthusiastas and takes you step by step through the program's capabilities.

But within seconds of reading it though, came the bitter disappointment. Games Creator is not capable of producing games that will run without the presence of the main program in

The tape loads rather unusually it makes the 64 behave like a Spectrum and you are presented with a title screen whilst the loading takes place complete with multi-coloured flashing lines surrounding it. Very clever, I wish I knew how they did that.

when loading is complete you see a menu page allowing access a menu page allowing access a menu page allowing access the page acceptance of the page currently in memory. It automatically loaded one sample game with the main program and there are two more on the reverse of the taps. These games are of the platform, mane and good old shoot-em-up types and any one of them can be changed in the minutest of detail.

A la carte options

The menu options allow you to alare the sprites, background, music, sound effects and the rules governing the actions of the player and his opponents or allens (as the surhors describe them). The background can be scrolled or static, but as far as I can tell it cannot be changed within a game to a new scene, even when moving to a new level.

The system for designing the scenery is a little complicated at first glance but very versatile once you've got the hang of it. The maste menu is absolutely first class, allowing you to write quite lengthy tunes simply by putting the right note on to the correct stave. Only one minor gripe here, no sharps or flats, and the state of the correct stave. Only one minor gripe here, no sharps or flats, and the state of the

The whole thing can be driven almost completely with the joystick making it easy to use for the little 'uns, but is sophisticated enough to keep us older folks amused as well. Your completed masterpiece can be saved to amuse and astound your friends when they come round, but why oh why couldn't they have gone just that little bit further and make them run on their own?

As it stands, though, it is a very interesting piece of noftware and, I think, well worth the price tag of \$12.95. Mirrorsoft themselves are prepared to buy original Games. Creator supported games, with the intention of offering them to owners of the main package, but I somehow feel that this defeats the idea of the program.

Adventuring with The Quill

Now, at last, to the real gem in the list of rumers. This next program falls into the adventure game category. It's called The Quill from Gilsoft and it is, at last, a true text adventure designer in that it produces a stand alone game (one that doesn't require the host program to be loaded first) of marketoguality without the need for specialist programming

The Quill comes in an unfrepossesing black and gold package which belies the excellence of its contents. The program is on a single tape and is supported by an easy to read, two-part manual.

The first part takes you through the construction of a very simple adventure which, it followed casefully, will teach you enough about the program to enable you to tackle the first adventure game. The second part is a detailed description of the editor, interpreter and database that make up The Quill, forming a clear and concise reference for the serious user.

Load and run

On loading the program you see a very complete mean arranged in order of entry, and it's a good idea to have worked your game out on paper first so that the majority of entries can be inserted in this order. Further additions can be made later but it is important to stick to the order of entry as, for example, the interpreter cannot recognish a word if it so talready in the

vocabulary.

I've found that The Quill can
be made to go beyond the limits

stated in the manual. Although it is a text-only game designer, you can, for example access some of the Commodore's graphics (by using the CBM key) and with careful use of colours, reversed spaces and letters you can build some very pretty screens and

limited pictures.

Playing around with the interpreter in the 'event' and 'intant' labble can make some seemingly impossible things happen, such as causing secondary characters in your game to appear in locations of that that characters in a locations of the character. It is even possible to cause as almost random secondary of the character in control to cause as almost random secondary of the character in occur by secondary of the character in once to country that the country is the character in once to country with out of the character in once country with out of the character in once country of the character in once the country of the character in once the character in the country of the character in the country of the character in the chara

Your game can be saved to tape at any time as a database, which allows you to re-load it at a later date into The Quill for further work, or as a completed adventure for distribution among

your friends or even for sale.

I've been using The Ouill for
some time now and I market the
results. Very generously, the
authors of The Ouill do not mind
you doing this, asking only that
you mention their program in
your own.

In my opinion, The Quill is one of the most amazing programs I have come across. It does all the authors claim for it and a bit more. It takes the hammer and chisel work out of adventure game writing and leaves you to tackle the more important job of producing a logical and demanding result.

This is not to say that it is easy. The amount of work that goes into producing a respectably sized and reasonably presented adventure game is still, to say the least, prodigious. But The Quili frees you from the confines of Basic and allows content of the confines of Basic and allows content of the confines of Basic and allows content of the confines of Basic and allows content present in high game and a fall 45° it is cheap. Very cheap!

Conclusio

There are, of course, other untilines dedicated to the art of computer games writing and chief among these for the Commodore 86 must be sprite designers. Pre Spittle from Doord and Microscofts 60 Spittle from Advanced to the spittle from the spittle fitted crossed can be called games own programs. But there is no way these can be called games designers and the authors do no claim them to be on.

claim them to be so. Still, some software producers allow their advertising to get the botter of them. For example, the blurb on the cover of Scope claims it to be THE games clearing it to be THE games and the source of Scope claims it to be THE games the source of th

The same can be said for Mirrorsoft's Games Creator. The Games Creator is all you need to make your own complete and unique games' claims the advertisms, But it won't there is no way a list of data statements can be called a complete game. Games Creator is a very clever of the complete game. Games Creator is a very clever of the complete game, a sort of the complete game, a sort of the complete game. The can be assembled and reassembled time and time again.

not really what it is claimed to

but in the end it is still neccano. Of the three main utilities reviewed here only The Quill is a true games designer. Of course it only produces adventure games, but then that is what it was designed to be. Now if someone could combine the brilliant graphics with the excellence of The Quill we would really be getting somewhere.

BC BASIC Arlast the ultimate has arrived – a complete 9k extension in a ROM pack. Over 97 new or modified commands and functions have been added and because they have not been fully tokenised, the speed of operation is not affected. Abbreviations may also be used. PROGRAMMERS

WE ARE LOOKING FOR TOP QUALITY PROGRAMMES TO MARKET IN THE UK AND ABROAD. THE PROGRAMMES MUST BE OF TOP QUALITY AND IN MACHINE CODE WITH GOOD GRAPHICS AND SOUNDS AND ORIGINAL CONCEPT. WE ARE LOOKING FOR PROGRAMMES TO CARRY OUT WORK ON NEW MACHINES SUCH AS THE C.B.M.16 AMSTRAD AND M.S.X. WE CAN SUPPLY THESE MACHINES TO CARRY OUT WORK FOR MIRAGE. WE ARE ALSO OFFERING SOOD PRIZE FOR THE BEST PROGRAMME RECEIVED BY THE END OF FEBRUARY 1995 WHICH WE WILL DECIDE TO MARKET. WE OFFER AN OUT RIGHT PAYMENT OR 10% PLUS PAYMENT OR 20% ROYALTIES. FOR MORE INFORMATION CONTACT THE SOFTWARE MANAGER HE WILL BE GLAD TO LISTEN TO ANY QUESTIONS YOU MAY HAVE.

SOFTWARE HOUSES

WE ARE LOOKING FOR TOP SELLING PROGRAMMES TO DISTRIBUTE TO OUR WIDE RANGE OF OUTLETS THROUGHOUT THE UK AND GIVE YOU A VERY FAST SERVICE TO HELP WITH YOUR SALES AND TO MAKE THE MOST OF YOUR PRODUCTS. SEND A SAMPLE COPY OF YOUR PRODUCTS WITH RATES AND TERMS FOR A FAST ASSESMENT. FOR MORE INFORMATION CONTACT THE SALES MANAGER HE WILL BE GLAD TO HELP AND ASSIST YOU.

DEALERS AND DISTRIBUTERS

DEALERS WE HAVE THE BEST SELLERS FROM THE BEST PRODUCERS;
WE ALSO OFFER VERY GOOD RATES AND TERMS TO HELP YOU AND US
TO ACHIEVE THE BEST SALES AND SERVICE. FOR MORE INFORMATION
CONTACT THE SALES MANAGER.

DISTRIBUTERS HAVE YOU GOT THE MIRAGE RANGE ON YOUR SHELVES, IF NOT THEN CONTACT THE SALES OFFICE FOR SAMPLES AND RATES.

SALES MANAGER T.C. SAPHIER SOFTWARE MANAGER C.A. SAPHIER

We're not the only people who think 'Art Master' and 'Picture Builder' are two quite exceptional computer graphics software programs.

Tony and Rolf do, too.

Otherwise they'd never

have agreed to put their name to them.

- With both 'Art Master' and 'Picture Builder' you can create full colour pictures on your own T.V. screen.
 - And believe us when we say those pictures will match

the best computer graphics you have ever seen.

Anywhere.

The pictures are drawn using either the keyboard or a joystick, and can be stored on either tape COMPUTER SOFTWARE or on disk

> With 'Picture Builder' you are presented with a palette of 16 colour shades (more than enough for any budding

Michaelangelo). And a collection of character sets totalling over 250 shapes.

PICTURE BUILDER ON CASSETTE ART MASTER ON CASSETTE OR DISK FACH #9 99

year old right up to the 66 year old, will enjoy 'Art Master' and 'Picture Builder.'

So you're hardly stumped

You simply choose your colours and characters, then 'build up' your picture. Just like any other artist. With 'Art Master' you again get a choice of 121 colour

But this time you can draw whatever shapes you like. creating your very own high

The Ferguson TX MC01 has separate RGB,
Composite Video and Aerial inputs:
a choice of connections for Mccomputers, video games
and video recorders. These provide the CONTEST (and best) routes for computer and video signals to reach the tube.
The loop aerial shows that the MC01
Is also a portable colour TV.
And there's automatic electronic switching between functions.

erguson just monitor? e small print.

A glance at the screen of our new MCOI will tell you how far it is from being just a monitor. Or just a 14" portable colour TV.

One advantage of our double act is worth repeating, if only because it's another Ferguson first:

Electronic switching lets you change functions automatically from monitor to video recorder to TV

You can plug in any combination you want, and leave them permanently connected And wave goodbye to spaghetti junction around the back.

Convenience is matched by performance Computer graphics and picture quality are far better through our RGB and Composite Video inputs than through the aerial socket of an ordinary TV.

Computer audio output sounds better through the speaker of the MCoL(And if the beeps are too loud, you can turn down the volume)

The full potential of the MCOI will be revealed to you by your Ferguson Dealer; as will the optional Battery Converter which makes it totally portable; and the matching computer-dedicated cassette recorder 3T3l.

If total dedication is what you're after he'll tell you about our outstanding new 12" monochrome monitor MMO2 which is particularly suited to text applications.

But if you need a monitor for a home computer it makes enormous sense to get one thats also a colour TV. Especially when it only costs around £229.

And if you want a portable colour TV, why not get one that's also a monitor? In the Ferguson Monitor Colour TV, you get the state of two arts in one.

than waiting for your program to load. And good though the Commodore 1541 is, speed isn't exactly its biggest

feature. Hook up the new 1541 Express from RAM, though, and

you'll be up and running like lightning. This ingenious add-on speeds up data transfer from the 1541 and new 1542 disk drives to your Commodore 64. So much so, that you'll wonder how you ever found the patience

to wait before. With the Express you can load programs in a third of the normal time. That means less frustration and less time wasted. (You can fit it yourself in minutes, too - and disconnect it

just as easily). The new 1541 Express from RAM.

To shift your drive into top gear call into your nearest dealer today.

ATIVE SPARKS

America

Letter from America Christmas gifts from the USA

Dan Gutman reports

From his office high up above New York's snow-bound Central Park, Dan Gutman wonders what kind of presents we're all going to buy our computers this Christmas. Stuck for a good idea? Read on. This month, Dan looks at a few American offerings for the 64 that would look good in anybody's Christmas stocking - how about a keyboard that features Kermit and Miss Piggy? But to get your hands on any of them, you'll need to send a truckload of dollars across the Atlantic pretty quickly...

So, what's this about Mastertronic snaring 40% of the computer games market over there? Believe it or not, Americans haven't even heard of any company called Mastertros vet. In fact, the only British software company that's recognizable to us is Virgin and that's only because of Boy George. In this age of high technology and telecommunications, it always amazes me how that Atlantic ocean manages to get in the way.

Commodore Wars

Over here, we're all waiting for of their new Amiga "Lorraine" computer. It will probably be announced at the Las Vegas Consumer Electronics Show in January. There's an interesting aside to this story. As you Atari are long-time rivals in the Vic-20 was battling it out with Atari's 400/800 computer. After that, it was the Commodore 64 versus the Atari 800XL. Now that Commodore has purchased Amiga, everybody is wondering what Jack Tramiel and Atari will fight back with...

I just heard a very juicy rumour from the president of a big software company (who shall remain nameless). Atari is going to buy Mindset, a small computer company that has developed an just as astounding as Amiga's. With Commodore owning Amiga and Atari owning Mindset, the stage is set for the next generation computer war -Amiga versus Mindset. There should be more news on this

Christmas pressies

In the meantime, the old Commodore 64 ain't dead yet. There's a truckload of outrageous peripherals for the machine, and they would make dandy Christmas presents. I'll give you all the addresses of the companies that make them, so you can write away for more

 How about a replacement could die from old age waiting for Commodore's 1541 to load a program. A company called Indus makes replacement drives for the 64, the Apple, and Atari computers. I haven't seen it in action, but they claim the Indus GT is "the most advanced, most handsome disk drive in the world." Just what we need - a handsome disk drive. (Indus Systems, 9304 Deering Ave.,

Chatsworth, California 91311). By the way, Datamost has a new piece of software called "Kwik-Load" which speeds up the 1541 by 300% (Datamost, 8943 Fullbright Ave., Chatsworth, California that makes people want to improve on Commodore's disk drives?

Okidata has just released a really impressive color printer for the 64 that can produce more than 40 different shades of color and will print on just about any surface - even acetate. The most impressive thing about the Okimate 10 is the price \$239 American bucks. That's cheaper than just about any other letter quality or even dot-matrix printer. (Okidata, 532 Fellowship Road, Mt. Laurel, New Jersey 08054).

 Digital Research has developed a device that will interface the Commodore 64 and the Pioneer LD700 laserdisc player. It's not on the market yet. but it will be called Vidlink, and it's basically a connector cable plus a cassette or disk software program. Most likely, the first programs for Vidlink will be games along the lines of the arcade game Dragon's Lair. In the U.S., laser games in the arcades made a big splash last year, and then sort of died out quickly. But many folks (including this reporter) believe that the home is where you hang your laser, and we'll be seeing some home laser games in the near future that will revolutionize

The Commodore 64 is well known for it's brain-warping SID music. There are plenty of excellent music programs (Musicale and Music Construction Set, to name a few), but who wants to play a computer keyboard and pretend

this whole crazy industry.

it's a piano keyboard? Now there's a real piano keyboard that you just plug into the 64 and the two of them make beautiful music together. The Melodian Songbird is an

18-inch, three octave unit that can reproduce the sounds of up to 16 instruments, including brass, strings and woodwind. It features a built-in metronome, on-screen musical notation, and you can store your music on a floppy disk and play it back any time you like. You can also play a track, play another track on top of it, and play another track on top of that, and then listen to them all playing at once. I heard it, and as we say on these shores, it knocked my socks off. By the way, the president of the company, Harry Mendell, has Wonder, especially on his album "The Secret Life of Plants."

| (Melodian Inc., 792 Holmdel Rd., Holmdel, New Jersey 07733). Another new keyboard of interest is Muppet Learning Keys, from the same people who make the popular KoalaPad Touch Tablet. This one is made especially for kids, and it may be the only computer keyboard to feature Kermit the Frog and Miss Piggy, Instead of having to hunt all over the keyboard for a letter. all the letters in the alphabet and the numbers one through ten are in the right order. The MLK also displays icons of a compass. ruler, eraser and a blackboard on it. Best of all, a kid can smean ketchup, peanut butter, or anything else all over it and the stuff wipes right off. It also comes with some educational software. (Koala Technologies. 3100 Patrick Henry Drive, Santa Clara, California 95050).

Last but not least is an offering from Commodore. Have vou heard Magic Voice vet? It's a speech module that can only be described as cool. Light pens and touch tablets are fine, but there is nothing in this world like hearing your computer talk to you in a human-like voice. The Magic Voice cartridge plugs into vocabulary of 235 words, all spoken in a very pure and natural female voice. You can slow the voice down and speed it up, and it won't sound like the Chipmunks. Commodore also cartridges that will expand the vocabulary and introduce male voices and children's voices. Right now Magic Voice is being used for educational reading games and arcade games like Gorf and Wizard of Wor ("Ha-ha ha Space Cadet"). But eventually, it will be able to read books to blind people and talk for speechimpaired people. It's really

THE 64's DRUM MACHINE

s you might guess, this rhythm section hangs out i the SID chip. If you've spent much time making music on your Commodore 64, you've probably already met the bass player. With the right waveform and envelope, you can get a pretty good bass sound.

You may not know, however that if you use the "noise" waveform, you can imitate a drum set. This article will show you how to get a simple rock beat and combine it with a base

line and melody. When you tell the drummer who is practicing next door to 'keep the noise down', you are not far from the truth of the technical definition of "noise". Noise is a random mixture of all pitches, and is the main ingredient in the sound of drums. In fact, it has become common to add pure noise to cymbal sounds

The noise output of your SID chip does not sound exactly like a drum, but it gets pretty close. Type in this program below and

The key to making noise sound like percussion instruments lies in the settings of attack, decay,

remainder. The maximum for in the recording studio. each is 15, the minimum is 0. This means that we are setting the attack at one and the decay at two - but what does that mean? It means that the sound and then falls almost as quickly to the "sustain" level. In this case

as the envelope, or ADSR, If you haven't worked out these terms before they must seem mysterious, but this program can

Sawtooth and the Pulsewaves

help you understand them. Notice that in line 10 all registers, including the ADSR for voice 2, are set to 0. This clears out any old settings. Line 20 sets the attack and decay by POKEing SID+12,18. Because of the way your computer uses one memory location to set two different things, the actual values that are being set for attack and decay have to be derived with a simple formula. The attack is the number POKEd (that's the number 18 in the example) divided by 16, disregarding any

remainder, and the decay is the volume rises to full very quickly.

the sustain level is 0, so the sound volume drops to nothing.

cussive rhythms and lists the latest chartbuster from Sidney The resulting sound is like a

Try changing the 18 in line 20 to 22. This leaves the attack at 1, but changes the decay to 6. Now listen to the sound.

Did you know that there's a rhythm section inside your Commodore 64, and that a little piece of programming is all it takes to get it to rock? It may not be good enough for recording contracts or international stardom but you can certainly have a lot of fun with it. Tom Jeffries starts a new series on aspects of the 64's SID chip. This month, he shows you how to generate per-

Sustaining the attack

The sound volume produced by an orchestral instrument changes Electronic instruments like synthesizers usually have to reduce the complexity to a level that mere machines can handle. so each note is split into a few parts that are controlled separately. The attack, decay, sustain, release (ADSR) used by the Commodore 64 is probably the most common configuration

Line 70 changes the ADSR. POKEing SID+12,38, changes the attack to 2, which is a little slower, and the decay to 6, which is much slower. Sustain and release numbers are derived from the same formula we used for attack and decay, so POKEing SID+13,121, sets the

by Tom Jeffries sustain level to 7, medium, and the release to 9, medium slow. This combination creates the "cymbal" sound. Try changing

the values in line 70 to see how the sound changes You can set the speed by changing the TEMPO number in line 10. Notice that the timing loops are set up so that it is possible to fine-tune the rhythm. Basic is slow enough that it is necessary to adjust for the

amount of time it takes to execute the POKEs. Actually, if you listen carefully, you'll hear cuite a bit of variation in the beat - this drummer needs to practice. Most of these variations can be eliminated with a machine-code driver operating

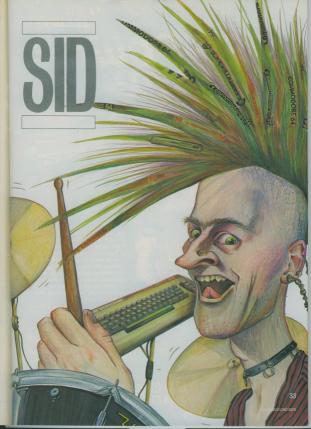

on the interrupt system, but that's beyond the scope of this article. If you don't understand all of

the filter settings (SID+22, 23 and 24), don't worry about it. They aren't crucial. They serve mainly to enhance the other settings. If this program doesn't sound right on your machine, try changing the filter settings, particularly SID+22, the cut-off frequency.

Using INTERPOD is as easy as this:

among SID chips, especially in the filters, so something that sounds great on one machine may not sound very good on another

White noise

Write your own tune Your notes have their own set of DATA lines starting at line \$00. Each 1/10 note gets four numbers.

melody note, the second two give the pitch of the bass note. high format so that, for example, middle "C" would be 195,16. If you want a voice to be silent for a particular Vis note, simply type in two 0's, and the note will be

shut off. Make sure that you set the counter in Line 100. If you put 16 numbers (four Vie notes) in each DATA line, you can simply set the counter to the number of lines. The program will only read the number of lines the counter

tells it to, so make sure you put in the right number

If you are adept at Basic programming, you won't have any trouble coming up with your own drumbeat, either. Just remember that anything too fancy probably won't sound guite right in Basic, so keep it simple.

I certainly hope you have a good time with the band in your computer. You can do me amazing things with the SID chip, so start experimenting!

There's one interesting point we haven't covered: the fact that this program specifies pitches for 20 REM noise, which is supposed to be 30 REM free of pitch. The truth is that only "white" noise contains all of the possible frequencies. Other versions of "noise" either seem to have some centre of pitch, or exclude some pitches. Commodore has cleverly arranged the SID chip so that we can get a variety of kinds of

waveform: Line 10 turns on the volume and sets the sustain to maximum Line 20 turns on voice 2 and then sets up a loop to increase the frequency one notch at a FOR T=0 TO 10 to 500 to hear more closely some of the sounds produced. You may recognize some of them from some of your

noises. Listen to the effect of

changing the pitch of voice 2 while it is set to the noise

favourite games. Now let's bring the rest of the band onstage:

Of course, you can insert your own DATA lines into this program to teach Sidney and the Waves your own song. Line 90 initializes the SID chip: you can leave it as it is or set up your own sounds. Trying to explain all of those numbers would take a book, so I'll refer you to one. Appendix 0 of the Programmer's "X" as performed by Sidney Sawtooth and the Pulse Waves

VizaStar integrates three important electronic aids to your business or home office.

A fast and easy-to-use package - VizaStar is a comprehensive information processor that includes an electronic worksheet, information filing system and simultaneous on-screen graphics.

VizaStar has been designed to incorporate the very latest in user-friendliness - so now you can handle your all-important information in many new ways and in a quick and effective manner.

The information filing capabilities of VizaStar enable you to store your information onto disk in

an ordered and instantly retrievable form. This means that you can quickly pick out individual or entire groups of related information to create lists, statements, labels or reports.

VizaStar is the ONLY program of its kind on the Commodore 64. Completely consistent with the VizaWrite word processor, VizaStar provides a totally comprehensive office system.

VizaStar costs just £99.95 (incl. VAT) from your computer dealer and selected stores. Please write for more details and the name and address of your nearest dealer.

COMPETITION

TASKSET ONE-LINER COMPETITION

WIN A DAY OUT WITH TASKSET

IN SUNNY BRIDLINGTON

So you think you're good at producing an exciting and original graphic display? Well, try producing one in just one line of Basic program

WHAT YOU WIN:

An all-expenses paid trip from anywhere in Britain to meet the Taskset team at home in Bridlington. Find out how the stunning graphics in Taskset games are produced AND help hem design graphics for their next game, earning yourself a credit on the game's insert card – make your friends multi-coloured with envy.

WHAT TO DO:

Using your Commodore 64 and the entry form below, write a one-line Basic program that produces a screen display with the word "Taskset" in it.

The competition	is not open	to employees	of

Taskset, or EMAP Business and Computer

Publications. Entries should reach this office by no later than 20th December 1984. The editor's

decision is final and no correspondence will be entered into.

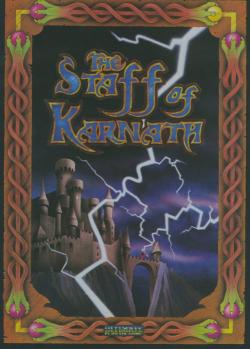

entered into.

10 Runners-up each get a pile of Taskset goodies, including T-shirt, mug, poster and, of course, a whole set of Taskset games.

Three programs everyone's talking about!

MICRO

Play the most exciting, challenging Olympic simulation of them all!

MICRO OLYMPICS is riding high in the charts—and no wonder. You are challenged to beat the world record in 11 realistic track and field events, with the packed stadium cheering you on to victory—or defeat! Just like the real thing, you'll want to keep on improving your sporting skill until you're up there among the creats!

MINI MOFFELSE

Turn your home micro into a true office workhorse!

MINI OFFICE is the most incredibly priced introduction to business computing ever offered. The package contains four full-scale programs — word processor, database manager, spreadsheet and graphics. They include advanced features not yet available on programs costing many times as much. Plus a concies 32-page how-to-do-it booklet.

Let your children embark on a magical micro adventure!

THE MAGIC SWORD breaks new ground in programming for the young — a complete adventure on cassette accompanied by a 48-page full colour storybook. Stunning sound and colourful graphics bring a completely new dimension to the classic computer adventure. And there's a very helpful animated compass to help you find your way around.

User friendly design PART THREE

Improving data entry by Chris Preston

Now we come to the central theme of our series on user friendly program design: the best way of arranging the actual data entry section of the program. We will base this article on an imaginary data entry section for a program that sets up and maintains a file of records, but the principles apply to any other data entry application.

The screen for the data entry 'Form' consists of a number of fields. Each of them has rules about what characters may be entered and how many of them. A cursor is displayed to show the user exactly where he or she is on the screen, the program allows you to enter and edit data, and to move from field to field - ideally, with the greatest of ease in both cases.

ACCOUNT NO	
SURNAME	
SOLUTALITY	
INITIALS	
TITLE	
ADDRESS	
WDDKE22	

POST CODE	
	_
ANALYSIS COL)E
CREDIT LIMIT	

All the details entered from the screen are stored in a file that can be used by other programs in the suite. The analysis program to allow the operator to print labels for everyone living in Hertfordshire who has expressed an interest in photo The operations to be carried out on the file are:

- · Enquiry
- · Amendment • Insertion
- Deletion

The first thing to do is to enter the account number of the person whose record we want to look at. Once the operator has done this, the program decides whether the record is already on file.

How it does this exactly is beyond the range of this article: maybe we'll cover that another time. But assume that the record is found: the details should be put on to the screen. and a message should be displayed in the status line something like this:

PRESS (A) TO AMEND: (D) TO DELETE: OR (SPACE) TO ENTER NEXT CODE

This gives the user the chance to examine the data before deciding what to do. Programs which ask whether the

THE PERSON NAMED IN COLUMN TO PERSON NAMED I

the dark; never a good idea. If you press (D) for delete, the program should ask you to confirm this.

DELETE RECORD? PRESS Y OR N

Don't forget that the program should accept (v) as well as (Y). If the user presses the (SPACE) bar to signal that he or she wants to look at another record, the cursor should be returned to the account number field (which should not be blanked). The operator may only want to change one character ('A1430' to 'A2430' for example), and we don't want to make the poor sod re-enter the whole field.

Browsing

At this point it's always a good idea to allow the user to move backwards and forwards through the file - say by using the (and) keys - to look at each record in turn. This 'browsing' facility is in fact essential where the key is not unique, as would be the case if we used the surname as a key instead of the account number - there are quite a few Smiths in the telephone directory!

Here we might be better off using the initials as a secondary key. That way, if the operator enters an initial, the program will search for 'I Smith' or whatever; but if no initial is entered the program searches for the first 'Smith' on the file. The problem with using initials is that people often leave out

their second initial. We might have records on the file for I Smith' and 'J A Smith' which in fact refers to the same person.

We are now getting quite deeply into the subject of 'system design', which is not really what the series is about. But this does show that even a simple data entry exercise like this one can be fraught with complications that appear only when the matter is studied in depth. There are many problems involved with using names as identifiers, and this is the reason why computer systems nearly always use codes of some sort in-

On with the show. Pressing (A) shows that you want to amend the data held on file. The status line should be cleared (that should always happen once a prompt has been obeyed) and the cursor positioned over the first field in the body of the screen, which in this case is the SURNAME field.

But before going on to the actual data entry operation, we must just quickly look at what happens if the record requested was not already on the file. If the record does not already exist the user may want to add a new record. Or you may have mistyped the key. Either way the program has to ask for more information:

RECORD NOT FOUND. PRESS (I) TO INSERT OR (SPACE) TO RE-ENTER CODE

The (SPACE) bar returns the cursor to the surname field ready for a new key to be entered, once again witrhout blanking the

If (I) is pressed then the cursor is moved down to the SURNAME field, ready for data to be entered. Here though, we can possibly ease the operator's task. A lot of data entry is repetitive; a field contains the same or similar information on many records in the file. To save the operator time and effort it is often best to leave the data from the previous operation on the screen; as we will see shortly, using a well-designed data entry scheme, editing is no problem.

If the insertion is the first operation in the day, have some built-in defaults which you can display. For example the company may have a 'standard' credit limit for its clients of £1000, so put 1000.00 in the CREDIT LIMIT field ready for the operator. That way, if the default value is correct he or she just has to press the (RETURN) key to accept the data. This is just our philosophy of making things as easy as possible for the operator.

Of course, we cannot have any default for a name field. But leaving the previous record on the screen with its name field can act as a kind of prompt.

Now at last we come onto the real data entry side of things. Our aim is to make life as simple as possible for the operator. To do this we have too implement a complete set of editing kevs: data entry systems where the only control allowed is a "DELETE" key which deletes the previous character are not

uncommon, but really they aren't worthy of the name Before coming on to control keys though, let's consider 'normal' data entry - where the user enters the correct data without having to do any editing.

First of all, he or she must be told how many characters can be entered in a field. This could be done by displaying a character such as a hyphen to show each available character position. As data is entered, these are overwritten; so when the cursor gets near the end of the field, you can see immediately how many spaces you have left. When the field is full, a beep should be given and the key ignored if you try to enter any more characters.

Some fields have restrictions on the characters which canbe entered. Numeric fields obviously only allow the digits 0 to 9, the decimal point and the minus sign. Other fields may only allow Y and N. or some other combination of letters. In fields such as these pressing any illegal key should again produce an immediate beep and maybe an explanatory message.

In numeric fields we also have the restriction that we can only have one decimal point or minus sign; and that minus sign must come before any digits. Numeric fields are also somewhat strange in that the data in the field will be right justified when the cursor comes into it, but the operator will want to start putting in data from the left-hand end of the field. There are two ways of handling this. The cursor can be placed over the leftmost position in the field, rather than at the first character of the field.

& roylamin

If the value in a numeric field is being changed at all however, it is probably being changed completely. So there's a case for saying that the cursor should appear in the first character position as normal, but if the operator tries to edit the field (by pressing any key other than Next Field, Previous Field or RETURN) the field should be completely cleared. This looks a bit drastic, and it does tend to startle an inexperienced user; but it's not as bad as it sounds - as once

the operator has got used to using a computer, he or she will tend to re-enter short fields completely in any case, without bothering to use the editing keys.

 Cursor Left and Cursor Right: these keys allow you to move the cursor around within the field. If you try to move outside the field, the computer should beep and ignore the key. Previous Field and Next Field: the normal cursor up and

cursor down keys can be used to move the cursor between fields 'up' taking you to the previous field, 'down' moving to the next one. The RETURN key also takes you to the next field, and will of course be the key normally used for this pur-

If the user quits the last field on the screen, we can assum that data entry is complete and ask if he or she is satisfied with the data. If 'PREV FLD' is pressed when the cursor is in the first field, the program should beep and the key should be ignored.

 Insert and Delete: the user should be allowed to insert characters only until the field is full. Systems which allow you to 'drop' characters off the right-hand end of a field by pressing the insert key are making it too easy to make mistakes.

Similarly, if you use the Commodore system where the DELETE key deletes the character before the cursor, rather than the character under the cursor (which is more natural), then obviously the operation should get beeped if he or shepresses DELETE when the cursor is in the first position of the

Note that pressing INSERT should insert a space into the field, but pressing DELETE should cause a hyphen (or whatever) to appear at the end of the field so that you can still see how many more characters could fit in.

• Clear Field: the CLR key is ideal for this function, clearing the whole field from the current cursor position to the end of the field is invaluable when the user is replacing a long entry with a short one, because it saves having to key lots of spaces to wipe out the end of the old data.

· Home Cursor: this key takes you back to the start of the field, and we can use the HOME key for this purpose.

RETURN: carries out exactly the same function as the 'Next Field' key. And of course it is the one which is usually used because it's easier to press.

 ESCAPE: as many Commodore machines such as the Vic or 64 do not have a specialist ESCAPE key, we have to make do with the Commodore key or RUN/STOP. The purpose of the ESCAPE key is to leave data entry immediately, without changing any data: it's a panic button for when you suddenly find that you've been amending the wrong record (in spite of all the help we have given by displaying the data on the screen). Rather than forcing the user to correct all the fields that have been changed, we let the user press ESCAPE: that takes the cursor back to the ACCOUNT NUMBER field leaving the record originally selected intact.

Housekeeping

Whenever the cursor leaves a field, the field should be automatically tidied up. Alphanumeric fields should be leftjustified and any remaining hyphens changed to spaces. Numeric fields should be rounded to the correct number of decimal places and right-justified. If a field contains a money value, for instance, it should always be shown with two decimal places; so if the operator enters "15" the program should change it to "15.00" when the field is quitted.

Often there are limits on the values which can be entered into numeric fields. These may be absolute (the value must lie between 0 and 499) or relative (field 4 must be greater than field 3).

Absolute range checks should always be carried out when a field is quitted, because we can say categorically that if the value lies outside the range it is wrong.

With relative checks, though, matters are not so simple. If the operator tries to quit field 4 when it is in fact less than field 3, the problem could be either that field 4 is too big or that field 3 is too small. The best way to solve the problem is to do the range check after the second field (or after the last one, if there are more than two): and to do the checking only if the operator tries to move down. If he or she tries to move up, the range check shouldn't be carried out the user could be going back up the screen to change field 3.

It is definitely wrong, however, to leave the check until all the fields have been entered: carry out all validation as soon as possible! And if a range error is found, the computer should give a full description of the problem - not just a vague message like "ILLEGAL VALUE". Something like this perhaps:

CREDIT LIMIT MUST LIE IN THE RANGE 100,00 TO 999.90 FINAL VOLUME MUST BE LESS THAN INITIAL VOLUME

When the program finds an error in a field and warns the operator with a beep, don't blank off the data in the field. The operator should be allowed to inspect the data to see where the mistake was made; and if there was only one character wrong; we don't want him or her to have to re-enter the whole field (in which case he would probably make another mistake)

When all the data has been entered, the program should ask the operator . . .

IS THE DATA CORRECT? PRESS (Y), (N) OR (ESCAPE)

(N) takes the cursor back to the first field on the screen; (Y) means that he or she is happy with the data, and the record can now be written back to disk or tape. (ESCAPE) means that the user has decided not to alter this record after all, and puts the cursor back on the ACCOUNTS NUMBER field.

Well, you were warned that there was more to data entry than a few INPUT statements! There is no denying that writing a subroutine to handle all that is a lot of work. And what's more, it really needs to be written in assembler rather than in Basic: otherwise even the slowest of one-fingered typists will be beating the program to the draw.

But don't forget that the subroutine only has to be written once, whereas the user probably has to use the program day after day for years on end.

To sum up then, we are trying to make the operator's job as easy as possible by:

1 Giving as many editing keys as possible. You can even add some more if you want such as "RESTORE THE CHARACTER JUST DELETED", or "MOVE TO END OF FIELD".

2 Carrying our range checks as soon as possible, but still giving the chance to correct mistakes easily. Don't let your relative checks force the user to change the second field of a pair if it is really the first one which is faulty.

Supplying the user with suggested values or defaults which can be accepted by pressing (RETURN).

Making the operation of the program as natural and as consistent as possible. Try not to make the (SPACE) bar do one thing in part of the program and something else in another part.

48

Or play safe and choose somewhere in between.

At each level you're able to play either a friend or the computer.

(But be warned, it plays a pretty mean game does the Commodore 64).

You can also choose your team's colours, and those of the opposing team.

Which is great.

It means you can play for Chelsea one day, and QPR the next. Or Celtic, then Rangers. Imagine that.

Or you can play in your own team's colours against Liverpool...and thrash them.

NY OUR HANDS

With Christmas drawing ever nearer many a Commodore owners' thoughts are turning to what game they are going to buy to keep them occupied over the long Xmas and New Year Break

Well think no more 64 owners for your favourite computer magazine has solved the problem

for you. Commodore User is association with Melbourne House are able to offer you a splendid adventure

game at less than a pound. Melbourne House's top programmers have been working throughout the Summer, and what a game they have come up with. It's in the tradition of the new wave of adventure games with

moving animated graphics to illustrate many of the locations. This type of game was pioneered on Commodore computers by Melbourne House in

their excellent game. Zim Sala Bim Most adventure games fans will be familiar with Melbourne's other adventure hits - The Hobbit. Sherlock and Castle of Terror

The graphics are so stunning they would not be out of place on a Christmas card.

The object of the game is to attempt to stop an industrial dispute that is threatening the delivery of toys to children of the world.

It's Christmas Eve and not a child anywhere can get to sleep

with thoughts of the coming day. But unknown to them there is a problem at the North Pole which only you can sort out. You must solve the problems and get Santa's sleigh loaded. When all the toys are on board the reindeer take the strain and Santa takes off on his annual delivery round.

All you have to do to get your hands on Merry Christmas from Melbourne House is fill in the form below and send it off to us without delay. Your completed form together with a cheque or postal order for 95 pence must reach us before December 17th. Do not send cash through the post.

Merry Christmas from Melbourne House Merry Christmas from Melbourne House is as

- It's your job to see that Santa leaves the North
- Features include: Animated graphics locations
- Father Christmas and his reindeer
- This game will delight all the family at Christmas. From the leading adventure of company who brought you The Hobbit, Sherlock and Zim Sala Bim.

П П

Please rush me a copy of Merry Christmas from Melbourne House. I understand that this offer is made exclusively to readers of Commodore User. I enclose cheque/postal order to the value of 95 pence.

ADDRESS

SIGNED ...

The great Christmas Rush is well and truly rolling. Software houses are falling over themselves to release their wares in time to cajole your festive spirit. Whether you're an Adventure puriest or the occasional joystick grappler, the choice is so wide that you're sure to be tempted to take the can opener to your money box. Here's a look at some of the best software on offer...

A new tife from Level 9 is always recknowd to be an Event, and Pete Austin groupies wor't find anything to disappoint them. In the analysis of disappoint them in Return to Eden - which also marks Level 95 firm graphic offering. I'm still not sure whether pictures actually improve my enjoyment of an adventure - but that title visual appeal makes a to Eden features man't 200 costions (I'm told) and those I did manage to explore were interestingly and quickly drawn.

The storyline features unisexual here Kim Kimberley who, fresh from scoring 110% in Snowball, finds him/herself trying to beat a phony murder rap in downtown robotsville – and judging by what happened to me after my first wrong move, it sure is no place to take Strawberry Shortcake.

You'll encounter stacks of original, absorbing puzzles begging for logical and/or inspired solutions, but the truly confounded (or just simple cheats like me) can write to Level 9 for a free sanity-eaving clue sheet. Hock your lazerlance and buy a copy at £9.90.

The same Level 9 team are behind The Saga of Erik the Viking - this time on the Mosaic label - which takes its title and inspiration from Terry Jones' children's story - but don't get the impression that it's pitched only towards the younger player. Some 200 graphic locations await your attention, and very clear playing instructions and helpful extracts from the book will soon get you on your way. packaging and presentation of this as of Mosaic's other titles sets an excellent example; the

substantial library case even includes a spare parking space for the blank casseme you'll use to store any SAVEd versions of the game.

The two other new titles from

Monator are The Statalness Breel Rat Saves the World, based on Harry Harrison's classic timejuggling novel of the early To-(you even get a free copy of the paperback as a source of some cheel), and The Nomad of Time, developed from the Orwald Sastable stories of Michael Monorcock. They're both Monorcock. They're both produced to the control of Chronicles (rame), which seasures Chronicles (rame), which seasures

an above-average quality of program. All three titles are fastload and cost £9.95 each. Roster Tip

Is your enjoyment of graphic adventures spoilt by the dreaded raster roque; that distracting shimmering along the bottom edge of the hi-res picture where it meets the rest of the screen? It's sometimes possible to iron out this quirk in your own

Turkish Delight?

You've got to hand it to Melbourne House for offering the broadest choice of adventures ranging from the very playable Classic Adventure (fastload. £8.95) - their full text implementation of the one that started it all - to the visually entertaining but not so undemanding Zim Sala Bim (fastload, £9.95). This animated romp through the land of 1001 OPEC members on a bid to defeat the murderous Sultan really is a lot of fun, and pulls off some nice tricks with 3D scrolling, although my copy exhibited a tendency for the text colouring to degrade when I entered a wrong response. Clear and complete instructions. Not exactly my goblet of goar's milk but the youngsters will love it.

but the youngsters will love it. They're also sure to love Cuthbert Enters The Tombs of Doom from Microdeal. In fact, everyone will. This is what I call a proper arcade adventure; the fastioad tape comes in a decent case complete with a colourful booklet full of hints and mans

and an enigmatic key. Cathbert himself is a cute animated sprife, whom you must quide through the mysteries of more than 200 hi-res locations, evoiding assorted phouls, fiends, hornicidal bats, and other minority groups of the kind you'd expect to encounter only in the expect to encounter only in the you'd man play the property of the property of the property and fast thinking. Definitely a superior piece of merchanding, my son - and at a touch under ET, what can I say Triffic.

Casting a Spell

Sorcery from Virgin (fasticad, £7.95) comes a close second; a race against time, played out on 17 highly-detailed and colourful screens, to save Stonehenge fror the evil Necromancer and his sulphurous cronies. Forget what you've heard about earlier Virgin software (I'm sure they'd like you to); this is good stuff. Initial impressions of Roety. a

rollicking arcade adventure with accorse of novel screens and as many treasures to find, are also very favourable. It's among the first 64 titles on the new Freibird label from British Telecone. Ever so cheap at £2.90 and not at all narry. Reingames follow up their first graphic strategy game for the C64, Fame Quest, with Flame Island and Castle Fear (£3.95, More about these

In the realm of full-blooded areads action behind the thimest of adventure wells, ask your micro emporium to run the demonded of Stems Warrier from Frontrumer (£7.85, disk £9.95), which will give you some idea of the action this packs into five levels of play across 12 screens; it's different and the thunder and lighthmic are so realistic, they lighthmic they are realistic, they

and The Wizard's Citadel at 68.95 each from newcomers Triffid Software; an under-wraps title from Virgin based on The Eache's famous Dan Dare strip.

Book look

Finally, if your spouse/companion/ kids/rental company insist on reclaiming the TV this holiday. you can still avoid the season of goodwill by burying your mind in mopping up the product of a really imaginative mind, you couldn't do better than dig into Bruce Galloway's definitive guide Fantasy Wargaming (Patrick 222pp, £7.95). The first pleasant getting a hardback at that price. The second is that treasure trove of information it contains about characters, playing rules, comb magic and spells and almost every other element of the Bruce Galloway's thoroughness

is exemplary, and the 60

introductory pages describing medieval society, myths, legend and religion alone are enough to trigger 101 ideas for your own adventures. And that's the strength of this book. It must be almost indispensable if you're a legitimate Dungeons and Dragons player, but if you have half a mind to start writing your own board or computer-based

fantasy games, there's absolutely loads in it to help you. I can't believe that anyone will ever produce a better book of this kind; specially good value You won't need to cash up cruite so many book tokens for your copy of David Estall's paperback Adventures For Your Commodore 64 (Virgin. 128pp, £2.95), and it'll give you plenty of hours at the keyboard once you get the TV back. Here you'll find listings for six complete games, including Schools Out and Hunt the Wumpus for the younger player, to Pearl Diver (with sprites and sound) and The Guardians of Arimathea - a pretty meaty text adventure that's not half bad. The structure of the individual programs isn't described, but they're obviously open to your

own study, and the author adds a

adventure writing for the novice

Altogether an excellent buy for

the beginner player/author - and

for the more experienced gamer

who wants something a little less

demanding to go with the white

useful half-dozen pages on

burgundy.

DONT forget that there's a treshly-minted copy of A J Bradbury's bock Adventure Games for the Commodore 64 (very favourably reviewed last month) for the neatest tignimi routine for enhancing adventure test screen display or presentation. Why not drop me a line with your idea now? Well publish the best two. Meanwhile, here's wishing you all an Adventurous Christmas.

TALK LIKE 64s DO

Speech synthesisers for the Commodore 64

In the never ending quest to let you do more with your computer than just play games, speech synthesisers look like being an attractive (yet expensive) proposition. Just imagine it, your beloved Commodore 64 being able to talk to you. At least two speech synthesiser packages are now available for the 64 Kevin Bergin has conversed with Speakezy from JCB Micros and Currah's new Speech 64 package, and asks himself whether all this talk isn't just a lot of hot air.

by Kevin Bergin

talk to you is not real news. A number of synthesisers have been around for quite a while: like Adman's package for the Vic, JCB's for the Dragon and Currah's for the Spectrum. The those earlier versions for the Commodore 64. Bringing up the rear is Commodore with its very own Magic Voice speech module. Available (hopefully) by Christmas, it works on a different principle to the above, but is worth including for the sake of completeness. But let's get going with the newest offering, Speech 64 from Currah Computors.

Speech 64

Speech 64 is a cartridge that not surprisingly plugs into the cartridge port of the 64. It has a DIN plug that goes into the 64's audio/video socket. This will cause problems for people using that port to drive a monitor. Although nothing is mentioned in the instructions. Currah will supply you with a video cable correct both devices simultaneously. The audio socket lead is very short, making it difficult to have the sound go through an amplifier. Anyway once the cartridge is

switched on, the device is initialised with the simple command: INIT<press return>.

From here on the 64 will voice any key you press (providing the standard pronunciation. There volume is turned up). This can be fore using the look-up table and

writing programs. No need to worry, the cartridge can be turned off with the KOFF, and on again with the KON commands. You also have the choice of two voices: low or high, each offered with or without inflection. This does give a wide range of different sounds

Programs that talk

Presuming you wish to hear your 64 chattering away there is a wide range of choices when 'speaking' from a program. Currah have used the by now familiar SAY command. With this the user may simply type in a word between motes for example: SAY "WELCOME" and the synthesiser will try to say 'welcome', but like many words it will need to spell it as it sounds; SAY "WELKUM"

A few words of explanation here. Speech 64's software works by scanning the text you've inputted and then converting it automatically into the speech sounds required. The manual calls it the 'speech to text converter'. It does this by putting together a set of allophones (the component sounds that make up a word) from its stock. Although it uses a set of pronunciation rules, it can't cover every eventuality - like some of the

baffling spellings you find in the English language. So you're provided with a fairly impressive look-up table for non-

allophones, it is possible to create a likeness of most words and in any language (the review was conducted in poor English). Delays can be produced by using standard punctuation and the cattridge will give friendly error messages if you are using it from Basic. All of the aforementioned

All of the aforementioned methods can be combined. For examples, speech may be examples, speech may be produced using the SAY command with text, and allophones inside square brackets. Typing in text in upper case gives a bigher intonation, whilst lower case gives a much deeper voice. That's preety useful because you can approximate human speed partners arther than being stuck with a droning monoconous voice. But you can't be.

use it in Text to Speech mode. Currah claims that Speech 64 does not slow down the 64 as the cartridge uses a buffer, which allows speech and other operations such as graphics to be produced at the same time. The problem is that any speech will take a lot longer to finish than most other operations (animation for example), this means that the overall effect is a

Documentation

Almost non-existent is probably the best way to describe the manual. It comprises sixteen (very small) pages of information on Speech 54. The first two papers deal with installing and initialising the cartridges, a couple of examples are given in the form of direct mode statements to turn the cartridge on and off in both voices. The next two pages take you briefly through the 5AX command with text and allophones. Another two pages are given over to allophones, with a couple of words on error with a couple of words on error with a couple of our different voices in a page on different voices in a page on different voices and one on the speech buffer.

So far, this is all very elementary stuff on using Speech 64 from Basic. The next four pages are on using the device with machine code. Is this any better? No. afraid not. Currah start this section by implying you will have a long slog using machine code with Speech 64 not very inspiring. However, the manual does go on to give you four small examples with brief explanations. The program to initialise the device from machine-code is given, and an example program that uses the 256 allophone speech buffer. There's also a brief explanation of how to get at the speech chip directly, without using the aforementioned INIT routing

There is one page containing the decimal and hex codes for the allophones. That's useful because when you're using machine code, you will need to convert the allophones your're working with into hex A speaking clock program is also listed on the penultimate page. The last page gives a list of the commands added to Basic when Speech 64 is initialised, which includes the first and only mention of the BYE command. This turns Speech 64 off until an INIT command is issued.

Using Speech 64

So what can you do with Speech 647 You can, of course, include it perhaps colored to the course of the colored to the colored course broases that were producing cames using the device. In fact only few checked out, the rest either add nothing or said they habit the colored course of the course o

there seem to be no other takers. For £29.95 it seems that you get a fairly powerful if a little poorly documented speech synthesiser. How much one likes or dislikes it must be a matter of opinion. It seemed very slow and clummy to use, as well as being a rather tinny re-production of the real thing — certainly not up to

the best arcade standards.

The last comment must be that any speech synthesiser should have extensive software back-up if it is to be more than a novelty, and there seems to

be no substantial software in the making for Speech 64. As a footnote to this review Currah have just informed me that a number of software houses are showing interest in Speech 64 and a statement is to be issued by Currah in the near future.

Speakezy

Like Speech 64. Speakery is a cartridge that phags into the cartridge port on the 64. And it works in more or earlier to the cartridge port on the 64. And are works in more or less the same way by using a standard set of allophones. In also has a Dilught that fits into the 66's audio/videog a splitter lead to enable you to use a monitor. When the 64's is switched on Speakery is initial-issed immediated.

Speakery adds four commands to Ratic, they are \$X1, \$PERA.

ADD and WAIT ON. The device and its commands are very easy to use. The \$X7 command is used with one of 27 gra-defined words, so you have a fixed library to work with. The library includes any number that the \$4 can generate \$Speakery will also \$X8 *mmeric strings and \$2.00 mmeric strings are \$2.00 mmeric strings are \$2.00 mmeric strings and \$2.00 mmeric strings are \$2.00 mmeric strin

the value.

Unlike Speech 64, Speakezy needs to be told when to turn its voice off, each word needs a

continued from page 57

americ delimiter between 0-5 separated by a comma. Speaker also uses allophones with the command SPEAK. The format for this command is the same as SAY except the words must be spelled as they sound, each allophone must be spelt correctly and separated with commas. The manual also points out that the SAY command is compatible with all Basic string-handling commands on the 64. So you can define phrases as string variab and add them together, even slice and concatenate them within a Basic program.

But there is also an ADD command which is used to join words together that are constructed with both the SAY and SPEAK commands. The last command is WAIT ON, although this is not a new command its use with Speakezy is unique. The command WAIT ON can be used to halt the processor if Speakegy is still talking, this allows the user to check that words are not overlaid

Documentation

The Speakery manual is a good introduction and quide to Speakezy's facilities. Each of the commands gets its own section with the addition of at least one demo program. And all possible error messages are covered. Like Speech 64, there is a limited amount of technical information and advice if using machine code, but ICB does offer assistance to anyone wishing to write or telephone. Finally there's an alphabetic list of the predefined words and a list of allophones with some helpful notes followed by an allophone

Conclusions

Much the same things must be said here as for Speech 64 but with more praise for the good documentation and ease of use. On the other hand there seems to be no software at all available for Speakery, so you will have to amuse yoursel with the device alone. At £29.95 (same as Speech 64) it is perhaps worth experimenting with, but how long will it be before commercial software uses in-built speech synthesi or before the user discards the speech unit because there's really not much scope for really productive use.

Not true, there may be many useful and practical applications, especially for the blind and impaired of speech. At present, though, speech synthesisers seem to be just for

Magic Voice

Unfortunately Commodore's Magic Voice cartridge couldn't be put through its paces here because, despite the length of time it's been talked about, the product is not yet available in Britain. So a few preliminary details must suffice.

Magic Voice works differently to both Speech 64 and Speakegy in that it doesn't use allophones to build words, but a system of digitised speech - so you don't get an infinite vocabulary. In fact, the device is pre-programmed with a set of 235 'utterances'. But it does sound much mor realistic than the two aforementioned packages

because the words are actually digital recordings of a human voice. You have a choice of male, female or child voices and

control over the pace of speech. Despite the superior speech quality, its limited speaking range presents a few problems tell us that the device will allow you to define your own library of words but couldn't describe exactly how that was done. Apart from that, there will be a range of disks (probably not cassettes)

Using Magic Voice The cartridge should be in the its major selling point will be as educational software. The B J Bear learning series, for example, uses Magic Voice a optional enhancement. Other packages like Magic Garden and Magic Toolbox really need Magic Voice, and they won't be available until the cartridge itself appears. Two arcade games for the 64. Gorf and Wizard of Wor. also use it.

So it looks as though Magic Voice will be supported by software. But, at an estimated £49.95, its real value will take a shops in time for Christmas and lot of convincing.

CLIFF HANGER

Thrill to the cartoon style action of Cliff Hanger, a really original, Wild West game. As Cliff the hero, you've got to stop the bandito shooting up the canyon. But with its own brand of wacky cartoon action fun, things simply aren't as they seem in Cliff Hanger. For a start, the boulder you throw at the ol' bandito may just come bouncing back at you.

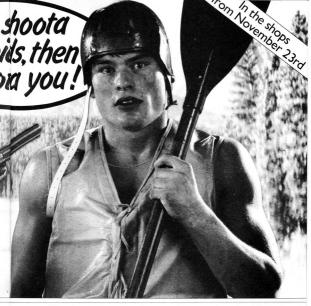

Cliff Hanger incorporates all the elements that have made New Generation games best sellers for the Spectrum, such as original ideas, superb graphics and hilarious happenings - but now it's available first for the Commodore 64. Featuring 50 separate screens, three levels of difficulty, one or two players scoring, Hall of fame and joystick compatibility or user defined keys, Cliff Hanger is set to be THE Commodore games playing sensation. Available from any good software store for just £7.95.

Shoot the Rapids

AUTHOR - PAUL BUNN

Ever wondered what it would be like to face the fierce white water in a top class canoeist slalom run? Well wonder no more because you can enjoy the fast action thrill of competitive canoeing from the comfort of your own armchair with Shoot the Rapids.

It's a game that involves real skill because you must move your joystick to simulate paddling action. You must get through the gates of the slalom course in the fastest time possible, while avoiding the river bank and rocks. There are also extra

hazards like rogue speed boats and interfering beavers to worry about.

This multi level game features increasingly difficult river courses with superb graphics and smooth scrolling along the river.

Qualifying times have to be reached to move onto the next course.

With Hall of Fame, one or two player scoring and joystick compatibility, Shoot the Rapids is probably the best sports action

"Mode" immulation game devised to date. Available from any good software store for just £7.95.

San Marie Les 222 19824

Spy Vs Spy Commodore 64 Beyond Price £9 95

Skill level: BBBB: Interest: #### Value for money: BBB Spy Vs Spy - the popular Mad Magazine cartoon strip is set to make its debut as a computer game in time for the Christmas rush

The game is the work of First Star Software the company headed by top American games writer - Fernando Her-Spy is produced under license in the

UK by Beyond Software of Lords of Midnight fame

The game features a unique splitscreen display which enables two

players to play against each other Alternatively you can choose to play

against the computer There are two Spies - each searching for the hidden briefcase and only exit from the embassy. Before you make

good your escape you also need to collect your passport, money, and key to get out of the building This would be a piece of cake were you the only intruder in the foreign embassy. What makes Spy Vs Spy different

Scrabble Commodore 64 Leisure Genius Price £12.95

Presentation: *** Skill level: #### Interest: BEES Value for money: ***

You would think that one of the advantages of a computerised game of Scrabble would be that it would enable you to get the game up and running pretty quickly, cutting out all that business of choosing a letter out of the bag, and using a matchstick for the missing Z. Not so with the version just launched from Leisure Genius. This monster takes a good fifteen minutes to load Take a slap on the wrists LG - most

tiles before this tape loads. Isn't it about time that all 64 software turbo loads?

That said - the software is excellent and provides something for that growing army of people who are sirk of jumping from platform to platform, gobbling fruits, and shooting aliens. Four different skill levels enable the player(s) to choose a game that will suit them based on their average performance at the board game, i.e. skill level one will suit players who average about the 300 points mark

Ghostbusters Commodore 64

£19 99 disk

Skill level: #### Interest: BERRE Value for money: *****

The idea is either shake the invetice or rapidly press the fire button to make your athletes move - the faster you shake or fire the faster your athlete

The first game we tested was Daley Thompson's Decathlon from Ocean. which was the closest of the three games to the original Track and Field Two catroon-style athletes compete in a series of track and field events - including Pole Vault, 100 metres dash,

One clever touch is that there are several advertising hoardings in the stadium with companies like W H Smiths, Boots, and Menzies, That must've sold a few eh hous? Next up was Activision's offering -

Decathlon, an authentic ten-event challenge for up to four players This scored higher than Daley's game on graphics and it also benefitted from

a larger screen presentation of the track The Activision game also had better

Who you gonna call? Ghostbusters. The pop song of the film hums in your mind as the computer game of both loads into your 64 Now we all know that a good film or

hurdles, and discus.

a good pop song is no guarantee of a good game - many games players have learned this lesson the hard way.

My suspicious nature is quickly put at ease when I read that the ghost offering is the work of David Crane. In case you haven't heard Crane's the name that keved Decathlon and Pitfall 1 and 2 for

The game begins in generous fashion by giving you £10,000. But before you start planning a world cruise this is not holiday money but working capital. You must use your cash to equip your ghost catching business. You'll need a

vehicle and traps to catch the spooks. The amount of money you speculate on equipment must be recouped when you set out on your rounds freeing the neighborhood of its unwanted ghostly

In true American tradition the idea of the game is to make as much money as is that there are two players racing against each other to achieve this objec-

By pressing the fire twice a pointer appears at a display of six gadgets to the left of the screen. From this list you can select a time bomb, bomb, gun on a string, fire bucket, spring, and map. These booby traps are used to impede your opponents progress and

The map will show you your position

in the embassy but loses you points collection Up to four players can play the game

using the computer just to keep the score and act as a board or, up to three In my opinion the game is at its best when used by one person playing against the computer. The computer is a much better opponent than a human being - not just because on its high skill levels it can play a very good game of

Scrabble but also because it won't keen One drawback of the multiplayer op-

vou waiting

each time you use it.

If you happen to walk into the same oom as the other spy you can either en-

gage him in hand to hand combat or Vitu can scarper The key to success in Spy is to keep an

eye on what your opponent is doing at the same time as planning your own strategy.

The animation of the spies is ex-Spy Vs Spy is a sure fire hit and welcome addition to any 64 owners' games

tion is that your opponents will have to seat themselves in rotation around the 64. Certain of the game-play options mean that your opponents will also have to look away from the screen whilst you think about your next move.

consider the computer prompts, and look at your tray of tiles If you like Scrabble and you've got a 64 you won't want to be without this name If it were not for this silly load time Scrabble would have ousted Zaxxon from the Screen Star spot.

you finally succeed it doesn't half feel compatible with cheap, fast, laser disk The game is moderately amusing and Attempting cartoon games with this technology is like trying to play

a brave attempt to try something different. Somehow though - it doesn't quite

I found it repetitive and lacking any real challenge - not really a game for the experienced player One day cartoon animation will make

computer graphics a thing of the past as far as games are concerned. But before that happens all micros will have to be

Mozart on the spoons.

sound affects and a more fluid animabe believed. Eight brilliantly animated tion of the running movement of the athletes. Although Activision performed well the gold medal has to be awarded to

Quicksilva for the game licensed from Epyx-Summer Games. This really is something special. Sum mer Games is also the most original of

the Games games - as it involves more than simply yanking the living daylights The graphics really have to be seen to

possible by trapping the ghosts and reaching the top of the Zull Tower with at least two of your fellow ghostbusters

The game still uses the buzz words from the film - ghosts are called "slimers" and the villains "marshmallow men". But are people going to know what these strange words mean as the game is launched several weeks before the film? Yes says an Activision spokesman "the kids know what marshmallow men are". Who's he calling a kid?

The catchiness of the pop song has

events plus an opening ceremony with white doves flying up into the sky and eighteen national flags for you to choose your favourite country The winning medals for the best Games game in the Commodore User

Challenge are awarded as follows: Gold: Summer Games, Silver: Decathlon. and Bronze: Daley Thompson's Decathlon

not escaped the manufacturers attention and the player is enduced to join in with the Ghostbusters chant at certain points in the game

The acid test for games based on film and books is would they still be good games if you have never heard of what ever it is they are supposed to be about In this case the answer is ves - excellent sound and graphics and a playable game. One gripe though - why should disk owners have to nay twice as much for the game as people buying it on cassette?

Joystick needed

Price £9.95 Presentation: **** Skill level: BBBC: Interest: BBBC:

Value for money: ####: When Sepa's Zaxxon hit the ar

cades two years ago hardened Space Invader fans couldn't believe the quality of the graphics. True scrolling 3D graphics, accurate response to joystick, beautiful colours and a thumping good shoot 'em up

Now this reviewer can't believe the name has been so faithfully re-Had I not played the game with my own joystick I wouldn't have believed it - especially as I'd seen a couple of previous attempts on

other micros fail dismally. It's taken several months and a legal wrangle to get the game into the shops after Synapse UK - a manufacturer of business software top American games house - slapped a writ on U.S. Gold stopping them from importing the game

under the Synapse name. A slight name change has enabled U.S. Gold to get the game out crediting it to a company called Synsoft - wonder what that reminds you of

Let me say straight away that this legal arrangement is good news for 64 games as Zaxxon is set to be come one of those games that no self-respecting Commodore owner would want to be without. For the uninitiated the game is ba

sically a space scenario shoot 'em stroy the evil Zaxxon - a giant robot that you can confront only after you have blasted your way through several preliminary levels. The first of these is the flying as-

ternid city. You must destroy as many of the enemy ground installa tions as possible in this level. The

more enemy aircraft you dest here the less you will encounter in deep space later in the game.

What makes the asteroid city the trickiest part of Zaxxon is the walls and electronic fences - over and through which you have to negotiate your shuttle craft.

On your first few cities the walls and fences are wide and far apart but on later ones you will need very skillful joystick control to get through the narrow gaps If you get through the asteroid

city your next challenge is a shoot out in deep space. This calls for a really quick finger on the fire button as you do battle with the aliens that you did not destroy on the ground Success in deep space also depends on correctly judging the distance and approach of the aliens no simple duck shoot this

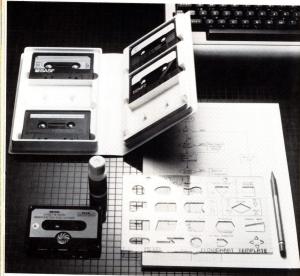

Now comes the final conflict as you seek to destroy the Zaxxon city. To do this you will have to score three direct hits on its missile

The robot is a difficult moving target and is armed with deadly seeker missiles.

It will take you a good few hours play before you even get on to the right city to take on Zaxxon - and several more hours before you get

If you manage this the game begins again only now it is faster and more difficult. The score you notched up in the previous game is what you take with you so it is possible to achieve some really ridiculously high scores - if, that is, you have the skill

Quite simply the best shoot 'en up for the 64

The Vic Adventurer's Guide

a comprehensive games roundup

Most good computer adventures need lots of memory, which means that the Vic, with its miserly 3.5K memory, looks like being a non-starter, especially since software houses are devoting their attention to the eminently more suitable Commodore 64

But the dedicated Vic adventurer still has a variety of games to choose from. Stephen Williamson introduces the different types of game you can expect to find in the shops. And he's compiled a comprehensive and up-to-date checklist of the adventure games available. Looks like there's more Vic adventure-fodder available than you though? by Stephen Williamson

Adventuring with words

First let's consider text-based adventures, an art pioneered by the near-legendary Scott Adams. His series of adventures is available on cartridge from Commodore. These can all be relied upon to contain intriguing puzzles and well-written scenarios but don't expect to find hundreds of locations. Notable Adams works are Adventureland, suitable for beginners as well as stretching the imagination of the more experienced adventurer; and The Count, perhaps the most difficult of the series to solve. Kraal's Kingdom is a 32K text

adventure from Buntasoft which overcomes the Vic's memory limitations by loading in two 16K sections. The code needed to play part two must be discovered in part one. The adventure incorporates some neat sound effects - doors breaking with a bang when you smash them open and you can hear the river water rushing below you as you try to cross the broken bridge. At £4.95 Kraal's Kingdom is very good value for money and takes lots of patience, ingenuity and imagination to complete

For sci-fi fans Buntasoft has written science-fiction adventure, Marooned, in which you search an alien planet for a spare part needed to repair your damaged snacecraft.

Romik has issued a low price four-game pack three text adventures together with a set of puzzle and strategy programs called Mind Twisters – all for \$10.98. The Golden Apples of Zess is a gentle introduction to the world of adventure with comprehensive instructions, simple problems and few locations – definitely not for the experienced adventure. But

> Pharoah's Tomb another arcade game

posing as an adventure

Sword of Hrakel - will keep you up until the small hours.

Zok's Kingdom - arcade game dressed up as an adventure.

Animal Magic and Sword of Hrakel are something completely different and are worth busing the set for. Both games fulfill the required criterion - that you end up playing them until the early hours of the morning, deter to get just that little bit further into the adventure. In Animal marric as dawn broke I reminisced on my night's quest I'd dehydrated in the desert. nearly froze to death in the forest, got turned into a frog and overcome a herd of elephants by a very simple device that had taken ages for me to work out. And all this in search of a baby kidnapped by an eagle. Certainly makes a change from all those distresed princesses that I usually have to rescue in adventure games. As for The Sword of Hrakel, how do you catch the attention of a meditating guru and of what use is an agitated duck?

text adventures I've played: Macric Mirror, Rescue from Castle Dread and Curse of the Werewolfare all worth tackling. I particularly liked the Curse where attacking monsters do not always kill you outright but gradually weaken your constitution whilst you struggle to find ways of killing or getting past them. A weak constitution reduces the number of objects that you can carry. Some objects are placed randomly so that each time the game is played things are not always the same. Tricky

The three Terminal Software

Martech's The Quest of Merzavid finds you seeking the magical firestone hidden by a dragon. A fairly short adventure and not too difficult to solve but with some touches of humour. I tried making love to the serving maiden in the tavern but had trouble with her big brother when he saw me. I did a lot of

77

drinking in that tavorn. Finally, Exploring Adventures on the Vic is a three adventure cassete published in conjunction with a book of the same name by Peter Gerard where full listings for the adventures can be found. A line by line commentary on Underground Adventure is an escollent introduction to the art of writing adventure programs, though the grain staff requires a confidence of the property of the control of the confidence of the con

Graphic Adventuring

Graphic adventures for the Vicvary from those like Dumpons which require a measure of strategy and forestight to play, to Samlock's Sarship Escape which rolles more on quick reactions and the 'shoot' emu p skills' of the arcade game. Several have a similar theme - a man wandering around various chambers batting guards and searching for

treasure. Outstanding amongst this type of game is Pharoah's Curse from Hesware, available on 'turbotape' which, by some miracle of programming takes just over a minute to load the 16K program. It's a game for adventure and arcade fans alike. The action rakes place in various sections of Pharoah's Tomb and is fast and furious with mummies to fight. traps to avoid, treasure and keys to steal, doors to unlock, ropes to climb, lifts to ride and a winged avenger who carries you off to the darker recesses of the tomb. Graphics and sound are excellent and I am swiftly becoming a Pharoah's Curse addict.

After trying Pharoah's Curse I was eager to get to grips with The Wizard And the Princess,

from Melbourne House. It's a five part graphical adventure for the unexpanded Vic that has featured in the Vic best-seller lists for some time – someone out there must like it. Sadly, I casme away disappointed after only a few minutes.

rew minutes. The games are written in Bazic with unimpressive graphics and have the fifteery animation that have the fifteery animation that have been as basic game, After playing sense as the instructions call them you have to wait until the next section loads. You must find a castle, battle a dragon, get lost inside a 3D maze, rescue a princess and take her across a bridge guarded by a Troll – all in a

day's work, no doubt. Zok's Kingdom and Pharoah's Tomb from Anirog are two more examples of the graphical character wandering around various chambers. But whilst there are some monsters to avoid, the emphasis in both games is on problem solving finding just the right equipment needed to enter locked chambers, cross moats or lighten darkened rooms. Zok's Kingdom should baffle you for a while, though Pharoah's Tomb suffers from a man who wanders painfully slowly across the screen in response to pressing direction keys

The same criticism applies to the hero in Audiogenic's The Tombs of Drewan who meanders through the silent, (no sound in this one), 400 chamber tomb. Each quard encountered has a different strength value, so weapons must be chosen carefully. A powerful petrify spell is wasted on a weak guard. No puzzles to solve here; you just search for the four magical runestones and an amulet. There is a save game facility to allow you to go to bed and live to fight another day. Not a classic, but worth a few games.

Trading with aliens

The Trader from Quickellya is a science fiction adventure in the science for adventure in the 18K parts in which you play the role of a trader wheeling and dealing with various allens on planets within the Meridien System. The object of the game is both to survive and to make a fat profit after your journey to the alien worlds. Some simple arcade games are included to liven things up a bit. And random leven things up a bit. And random

elements provide some variety each time the game is played. There are some nice pictures to look at. Fine examples of what can be achieved with a bit of ingentity using those built-in Vic low-ree graphics characters. I enjoyed my first trading journey, though I did fall down a pit to my doom near the end of the adventure, and I drove some hard bargains. However, after a few plays, the novely of the game began to wear off. There did not seem enough stimulation

in Trades for the game to have lasting appeal.

One of the first non-computer role-playing games was Dungeous and Dragoes, complex game using lots of dice, players joining things down with pencil and paper, in which a fantasy world was created in the imagination populated with heroes monsters; marie, and the pencil players.

imagination populated with heroes, monsters, magic, and the like which often took place within the confiners of a dungeon system. The Dungeons and Dark Dungeons from Anirog are two games written by the same author that seem to recreate some of the appeal of Dungeons

and Dragons.

A character is generated by
the computer who possesses
arributes like strength, intellect
and destretty. You choose to be
a fighter or a magician and after
purchasing waspons and
corpument, you are planged into
a 1D mane dampon inhabited by
monators who quard treatures,
your quest. Single letter
commands are used to make
decisions about movement,
combat taking objects, diriching

as a fair amount of lock.

Dark Dangoon uses a similar system to Dungoon but has a different set of monsters and torches which burn out very quickly leaving you to wander around in darkness. It may lack the problem solving of some adventure games, or the fast action of Pharcal's Curse, but it's very challenging and will grow on you.

potions and consuming food

(which must be taken at recular

intervals to prevent starvation).

Survival is difficult and requires

judgement and strategy as well

So it looks as though there's a reasonably wide ramps of adventure games available on the Vic, for all tastes and tereind almost all of the software houses, you can expect little in the way of new adventures in the near future. Only one software house, Sophisticated Games, had anything new to report — a 380 location, tempart adventure called Lower's Ladours, coming some

A truly proffesional design standard light pen drawing package. You really can draw accurate detail drawings quickly and easily using this superb 100% machine code software supported by an extensive and helpful manual. Built in architectural and electrical symbols with facilities to add an unlimited

number of your own symbols eg: musical, mathematical etc with others to come soon from Stack. Printing routines are included for CBM and Epson printers and custom drivers can be added. For fun, ten games for the pen are included in the pack together with two sample pictures. All supplied on two double sided tapes

with instructions for transfer to disk operation. You really must see this to appreciate just how good it is.

COMPUTER PRODUCTS

THE ROTRONICS DR2301 COMPUTER/ AUDIO CASSETTE RECORDER

The Rotronics DR2301 has all the facilities you would expect of a quality audio recorder and also works perfectly with the VIC 20 and CBM 64 computers without any fiddly separate boxes or adaptors. Simply connect the DR2301 directly with your Commodore computer via

the lead supplied and you are ready to start. The built-in interface circuitry ensures that SAVEing and LOADing is completely reliable - even when using commercially produced software. The DR2301 also allows the

computer to sense when the PLAYkey has been depressed. Additional features are

auto-stop, tape counter, inbuilt microphone and foldaway carrying handle. The DR2301 is also compatible with the ZX81, Spectrum and many other popular home computers.

The DR2301 will take its power from the computer (Commodore only), mains adaptor (supplied) or internal batteries. Each unit carries a full 12 month guarantee.

accessories f

THE ROTRONICS PORTABLE CASE

Here is the ideal portable work station for home school or work. Specially made for most home microcomputers, it contains your VIC 20 or CBM 64 within a smart executive style case with removable lid for convenience in use.

The individually tailored foam insert securely protects your micro and cassette recorder (C2N or DR2301) during transit. Additional storage space in the lid holds manuals and up to twenty cassettes. A scalpel is provided to modify the insert for expansion units and an alternative

nsert can be supplied if you change your hardware in the future. The case is also available with uncut foam inserts.

All components remain fully operational within the case via inter-connections routed between the double layers of foam, so there are

no unsightly leads. The case has been designed for easy use with

each component positioned for convenient operation. The overall dimensions are 138mm x 725mm x 363mm ONLY £34-49 (p+p £2-50)

by Hadge Smith

Good graphics and sound make this a good game for 1 to 6 people to indulge their passion for the Turf. Each punter gets £100 with which to place bets on a series of six races to see who comes top of the Winnings Table. It's probably not up to ITV Seven status but at least

your money is safe. Here's a brief description of the program structure:

The main variables used are:-NAS - Punters Name BS - Horses Name

G - Capital V - Stake E - Selection

J - Position of Horse Lines 5- 120 Poke Data and set variables for sound and

colour Lines 200- 240 Ask How many Punters. Dim Arrays And ask for Punters Names Lines 510- 580 Set up screen for each Punter to input selection and stake, with Punters

name, capital and a list of runners. (See Screen Dump) In line 510, CC is the Race Number. In line 530, H is a default value to terminate the series of races if all Punters are broke, Error Trans are contained in lines 565-577 for wrong inputs. Lines 660- 705 Set up the Race Track with the horses at the start and Go-Sub 950-960 to play music (Fanfare). Lines 710- 770 The heart of the program where X in line 710

decides which horse should move, line 730 moves the horse and colour, lines 720 and 740 create the sound of

KEY REPEAT - FOR THE COMMODORE 64

This short routine lets you print any character repeatedly on the screen just by continuing to hold the key down. The routine is not affected by Basic because it's written in machine-code and is set up in the cassette buffer

by William Fong

Once you've typed the program in, you enable it (and disable it) by pressing F1. Then, if you hold a key down for more than half a second, the character is printed over and over again until the key is released. Pressing Runstop/Restore

totally disables the routine, but it can be recalled with SYS 832. Remember, once you've typed in the listing, make sure you SAVE before you RUN or you will lose everything.

```

PRINT AT - FOR THE COMMODORE 64

This simple routine lets you place text anywhere on the screen, without using all those tedious cursor commands. Remember, SAVE the loader before you RUN it. otherwise the NEW command in line 30 will destroy all your efforts. by Fred Reid

```
REM** 'PRINT AT' - EXAMPLE
3 :
10 PRINT"[CLS]"
20 FORP=24T01STEP-1
30 SYS49264, P, P, "WHAT ?"
40 NEXTP
```

When run, the FOR-NEXT loop in line 30 POKEs the code into the REM** 'PRINT AT' SUBROUTINE 2 : 49182. The routine can be used in 3 REM##USE AS SYS49264, Y. X. *TEXT* program or direct mode, and is 4 : 5 REM**WHERE Y=01024 & X=01039 7 REMAX BY FRED REID component between 0 and 39. Be careful when printing to screen 20 FORI=0T057 line 24, as this causes the screen

FIRST AID

for your 64

Computers, like people, are fallible. They need the right combination of code and care to perform effectively in the business or the home. And that requires first hand knowledge from you to create a healthy operating environment for your Commodore 64.

Knowledge about machine language, about the lesser known qualities of the 64, about the disc drives, graphics, and about the tricks and tips to keep your 64 on line. That's why First Publishing has now launched in the UK a series of high quality books and software packages to provide a complete health care kit for your 64. Commodore 64 users throughout Europe have already found it a tonic. We think you will, too.

For a brochure on all the Commodore 64 books and software packages available from First Publishing, please fill in the coupon and send to: Amanda York, First Publishing, Unit 20B, Horseshoe Road, Horseshoe Park, Pangbourne, Berkshire. Name	
Address	
Or ring Amanda York at (07357) 5244 or Calco Software at 01-546 7256 CU1	FIRST DURI ISHING IT

CASH CONTROLLER

COMMODORE 64

HOME BUDGETING & BANKING SYSTEM ON CBM 64 DISK AND CASSETTE

A professional style multi function Cash Controller program. In disk format you can load, and make an entry...or update your existing records ... in just seconds. This easy to use program can handle up to 400 transactions, glving instant statements of your bank balance.

BANK ACCOUNT

- Statements on demand from any date to date.
- Holds up to 400 transactions.
- Standing order facility.All transactions can be
- automatically coded to allocate up to 16 budget headings.
- Search facility for any single item by description or amount

HOME BUDGETING

16 budget headings, e.g.
 Gas, Rates, Car, Tax - you can choose the headings.

- Highlights under/over spending.
- Full budget expenditure
- breakdown.
 Budget "re-think"

facility. LOAN/MORTGAGE

CALCÚLATOR
All you ever wanted to know but didn't like to ask!

- Calculates:
 Interest rates
- Payback periods
- Capital sum
- Period of loan
- PRINTOUT FACILITY USING STANDARD COMMODORE PRINTERS OR SEIKOSHA GP 100VC.
- FULL SECURITY WITH PERSONAL PASSWORD.
 SAVE DATA ONTO CASSETTE OR DISK USING 1541 DRIVE.

AUTOCALC 64

COMMODORE 64

THE SPREADSHEET IN A

CLASS OF ITS OWN

O: Which spreadsheet is suitable for

accountants, engineers, scientists and home users?

A: Autocalc 64 is ideal for any application involving extensive manipulation of data and formulae from

financial planning to market research.

O: Which spreadsheet offers an advanced level of formula

handling?

A: Autocalc 64 copes easily with trignometrical functions, parenthesis and boolean logic as well as

totalling and averaging.

O: Which spreadsheet accepts complex conditional

statements?

A: Autocalc 64 can handle statements as complex as IF

a1<4,000 OR a1>8,000 AND a2 = 500 THEN b1=0.

Q: Which spreadsheet offers a flexible screen format?

A: Autocalc 64 allows you to select [1] column widths from 3 to 30 characters [11] the number of rows/

columns you need (iii) up to 2,000 cells of Information (iv) text or numerical entries lined up to the right or the left, or a combination.

O: Which spreadsheet offers a choice of numerical formats?

A: Autocalc 64 gives you a choice of [i] integers [ii] floating decimal point [iii] currency [iv] any combination of these.

O: Which spreadsheet offers a full 'replicate' facility?

A: Autocaic 64 has an advanced replication function for transferring text, data, formulae or conditional statements from any cell (or block of cells) to any other(s) without monotonous retyping. A 'go to' facility will take the cursor instantly to any cell of your choice—saving time.

O: Which spreadsheet is easy to use yet advanced in operation?

A: Autocalc 64 is designed to guide you — helpful error reports diagnose input or formulae errors. A full demonstration program and comprehensive instructions are included.

Q: Which spreadsheet is compatible with standard Commodore printers?

A: Autocalc 64 gives you a printout facility using any of these printers: Commodore 1515, 1525, MPS 801,

1526, MCS 801, DPS 1101, Selkosha GP100VC.

O: Which spreadsheet is 100% machine code for fast efficient responses, and offers a choice of saving to disk

(using 1541 drive) or to tape using a C2N unit?

A: Autocalc 64 — as if you didn't know!

O: Which spreadsheet sells at a realistic budget price?
A: Autocalc 64 costs just £14.95 on tape, £19.95 on disk inclusive of VAT and P&P.

inclusive of VAT and P&P.

Q: Where do I get one?

A: Ring us now on 06286 63531 (24 hours) to place

A: king us now on 06286 63531 (24 hours) to place your ACCESS or VISA card order, or complete the order form and send it to us today. (Prompt delivery promised). Autocalc 64 is available only direct from Richard Shepherd Software.

PLOT YOUR BIORYTHMS

A little practical program for the Commodore 64 to try on your 1520. It's ideal for plotting your own Biorythms, which for those of you who have never heard of them, are the basic 'life-cycles' which vary our physical, emotional and

intellectual abilities from day to day. by Chris Durham

The three cycles change at a different rate to each other. The Physical cycle has a 23 day period, the Emotional cycle has a 28 day period and the Intellectual, a 33 day period. From the day you're born these cycles are constantly changing their relationship, but there are certain factors that are constant Above the central line they are said to be positive, below the line they are negative. When they cross the central line, they are said to be critical. That means that on a critical day you're more prone to making errors or poor judgements - of course that doesn't mean to say you will have a bad day. Some Iapanese companies take

particular note of their delivery drivers' biorythms; and they claim accidents have been reduced by warning the drivers when they are liable to be less alert than normal. But, whether you believe in them or not, they are a bit of fun and the attached

title like The Complete Commodore 64 is a bold one. The 64 has a large repertoire of facilities and to try to include them all between two covers is a mammoth task. Granada have published many books on the 64 by various authors, and have now combined several edited versions into one weighty tome - just in time to capture the Christmas market.

The book is divided into 6 major parts, each one dealing with a particular subject. The first part is by Ian Sinclair from his book Commodore 64 Computing I reviewed this particular work in the October '83 issue. I refer you

to it for a detailed dissertation The 105 pages on Graphics and Sound is by Steve Money from his book of the same name. It describes character graphics, standard and programmable, including a PRINT AT simulation High resolution graphics is clearly explained and a short machine code routine to clear the hi-res

screen is provided. The next part is about games, and is mainly from the Commodore 64 Games Book by the Bishops. I reviewed this in the February issue and my comments still apply. The games require a lot of work for little result. A few educational games have been included for good measure. I would prefer to have seen this section cut down in favour of a larger section on graphics and

sound

The editor of this compilation is Allan Scott. He and A Bradbury have written a book on adventures for the 64 and 40 pages of it are included. It is well written and entertaining, describing the origin of adventures and some of the techniques used when writing them. Short programming examples are provided and useful text 'crunching' routines are explained. I learned more from these 40 pages than a whole book on the subject from various other

Part 5, Extending your Commodore 64, again by Allan Scott deals with joysticks, cartridges, other languages, disk drives, printers, speech synthesisers, light pens, monitors, modems and networks.

The final section is by lan Sinclair but this time on the subject of machine code. He offers a sound introduction and does not claim to cover all aspects. Assemblers and monitors are described with particular emphasis on Supersoft's MIKRO 64 assembler package

Several appendices offer lists of available software and suppliers, Hex to decimal converter, the 6502 instruction set and other odd fragments of information

For £9.95 you get about five books rolled into one, although somewhat abbreviated. Each one normally retails for between #6 and £7. It is excellent value for money and gives you the opportunity to sample the merits of several authors

Ken Ryder

The Complete Commodore 64 by Allan Scott - £9.95 Highly recommended, a good Xmas present

ore a collection of magazine articles than a text book, the aim and claim of the Screen Shot' series is step-bystep programming. Arranged in sequence, the articles go from absolute beginners right through

to writing a simple arcade game. These books are superbly produced and full of lovely colour. A novel feature is to use photographs of the monitor screen to illustrate examples and show listings - hence the 'Screen Shot' logo. But I found the listings difficult to key in. At 5 lines to the centimetre, the characters are very small and it's not easy to keep a straight edge in place.

Book 1 has the best introduction to Sprites and Sound that I have yet seen, complete with a useful selection of sound routines - engines, lasers, birds and more, otherwise, it adds little to the manual that comes with your computer. Unfortunately the demonstration programs are unimaginative and slow.

The use of ';', CHR\$ and even LET (on a Commodore!) makes mountains out of several molehills - a hangover, presumably, of this being one of a collection of such series for various computers.

Book 2 is mainly, but not only, about graphics: including bit map graphics, drawing and filling shapes and more about sprites both multi-coloured and animated. All this leads up to the usual task of writing a short arcade game. The game works but, written in simple Basic, it won't make a fortune for you in the arcades or software shops. A lot of useful stuff here but to follow the text, photographic listings and Mr. Cornes' individual style of programming takes plenty

Two books so far, and there are still two more to come - topics, as yet, unspecified. At £5.95 for each of these 64 page offerings .

always easy, way of collecting some good information and George Pike Screen Shot' Step-by-Step

modore 64. Books 1 & 2. Dorling Kindersley

The conclusion, Lovely to look at, but, at the price, not very good value

this is an expensive, and not

personal voyage of discovery into your home computer", claims the front cover. Data Log is a work book to 'teach vourself' to program in simple Basic, Its spaceship and starliner theme are clearly aimed at the younger enthusiast. As well as explanations and programs to type in, there are squared grids on which to design and write your own ideas. All very clearly laid out.

After a short, but adequate. introduction to PRINT statements. the 'voyager' is launched into colours the FOR-NEXT command and graphics. Immediately after that, equipment for the Starship Questar must be designed and drawn out. The quick change variety arouses and then holds interest and enthusiasm. A welcome feature is the detailed and regularly repeated, information on colour codes and screen locations - saves all that looking back.

By the time you've finished the book, most of the Basic commands, PEEK, POKE keyboard graphics, strings, arithmetic, INT, RND, music, time and sprites have been covered - a comprehensive introduction to the 64. There are separate sections on editing and on error messages - but these are not as

There is one important grouse though, I spotted a few simple printing errors: for example. wrong line numbers and FOR T=1T0750: NEXT N. With experience, that's easy enough to sort out, but it's very confusing for the beginner - just who the book is meant for. Otherwise, an excellent, imaginative and fast moving introduction to Basic programming.

detailed as they might be

Teachers will find Data Log a useful starter book for classroom studies, with plenty of scope to suggest variations and improvements - especially in screen editing.

"IT SAYS HERE "MR T SOFTWARE IS GENUINELY EDUCATIONAL IN THE NICEST SENSE"

Mr Teducational software from Good Housekeeping. is the most exciting way to introduce your children to the world of learning But you don't have to take our word.

Amongst a host of favourable reviews of Mr T, the Times Educational Supplement, no less, was moved to say: 'Bouquets should be sent to Good Housekeeping for a productive collaboration between teachers and programmers.

What inspired them to heap such lavish praise? For a start, MrT combines sound educational principles with the colour, fun, and excitement of computer graphics. (Brilliant stuff for 3 to 6 year olds' was The Lady's

All the games are designed to capture the child's imagination, with levels of difficulty increasing in line with ability

But the real beauty of Mr T is that you and your children operate the games and learn together, opening up further areas of educational play away from the computer.

Mr T also provides a useful introduction to computers, each pack including full loading and operating instructions.

All the areas appropriate to your child's early learning are covered: numbers, letters, shapes, measuring, money, reading and telling the time, with at least two games per pack. All the games are compatible with Commodore 64, Spectrum 48K and BBC B computers.

To sum up Mr T we'll leave it to a seven year old boy interviewed by the Daily Telegraph: The best thing I've seen in my life, was his verdict.

For full details write to: Ebury Software.

Control your home with your Vicor 64

Chris Durham

Part four getting 'feed-back' to your computer

So far in the series, we've looked at ways of getting your Vic or 64 to control external devices, simply turning things on and off at certain times. This month, Chris Durham explains how you can make your computer react to events as they occur. How about making your computer turn the lights on when you enter a room? But you'll need an imput board - either make the one described or buy Handic's VIC-REL cartirdge. Now read on...

What sort of input?

There are two types of input one can generate from sensors; analogue, such as a temperatur measuring device; or digital, which is just on and off. For most purposes the digital signal is quite adequate since even a device like a room thermostat sends a digital signal: temperature above the limit (off) or temperature below the limit

(on). Unless you want the computer to know the actual temperature there is no need to use an analogue sensor. The input board we'll build will therefore limit itself to 4 digital inputs both for simplicity and cost.

Although digital signals only have two states, there is also the element of time to be taken into account. A sensor might send just a quick pulse, or it might send a continuous signal when

on, such as the thermostat already mentioned. The board

can be used with both types of input since it contains a 'latch', to store the input until the computer is ready to check the input lines. Equally important, it can be switched so that it only registers when an input changes from off to on and then ignores it so that it doesn't retrigger the computer until it has been reset. This is ideal for use with a security alarm, where you only need to trigger the alarm when a window or door is first opened and the

input line is then automatically reset as soon as the door is closed again.

The Theory

The block diagram of a simple imput circuit with a latch is shown in diagram 1. This will register either a pulse or continuous signal and latch it until the computer has read the lines, then resets the latch. It suffers from disadvantages that the computer has to continuously scan the input lines to see if

there is anything there, and a continuous signal will keep being read even though it isn't giving any new information. The circuit in diagram 2 (shown for one input line only for

clarity) overcomes all these problems. Firstly the computer gets an interrupt signal to tell it to scan the input lines only when and secondly, there is a circuit ignore a continuous signal after it has been read once. Although it looks more complicated, there is very little difference in the cost the two circuits. Diagram 3 shows the full PCB layout for the 4-channel input board, using the

When a voltage is applied to an input, the opto-isolator (IC1) is activated and the output of the relevant pin goes low (0). This is

continued on page 102 101

froject

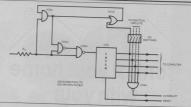

Diagram 2

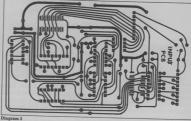

inverted to a high (1) by the OR gate (IC2) which activates the remains high until the computer has read the input, then a reset signal clears the latches on all 4 channels. IC4 is a 4-input NAND gate which sends the signal to the interrupt line of the computer (Flag 1) whenever an input

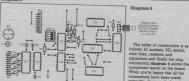

This can be tested for by checking the interrupt register to see if the FLAG interrupt bit has been set (bit 4 of 56589). If you don't intend to use this line then the IC can just be left out of the circuit; it will not affect the working of the rest of the board in any way. ICs 5-8 are for the 'continuous signal hold' circuit which is activated by the DIL switches (SW1-4).

Building your own PCBs Before we start, let's look at

components and PCBs. The fact is that the resistors and capacitors used are not critical You can get resistors from Maplin but both 0.4W metal film, suitable. Capacitors are disc ceramics unless otherwise stated; the Maplin miniature range being ideal.

As far as making PCBs is concerned, Maplin supply a range of PCB making materials. I use the rub-down transfers rather than a pen, since I find that this gives a more professional look closer together when necessary. Anyone making a PCB for the first time is advised to make a simple board first before attempting a more complicated design. Anyone but the DIY enthusiast can happily skip this section.

Constructing your board

The PCB is a little complicated since there are a number of ICs that extra care must be taken to avoid any shorting out between

tracks. Although it's not absolutely necessary to use sockets for the ICs, because they are CMOS devices I would recommend the slightly extra cost to avoid damaging them when soldering.

follows: IC sockets, DIL switch, wire links, resistors and capacitors and finally the plug connectors; diagram 4 shows the component layout on the board. When you're happy that all the connections have been made correctly, clean up the board and drill the mounting holes (If you are fitting it in the same box as the output board then it can be mounted on stand-off connectors thing to do is insert the ICs,

ensuring that you are at earth potential before handling the Solder the socket connectors

devices

onto the wires as shown in diagram Sa and Sb. The use of sockets and plugs for connecting wring is recommended, to allow the board to be removed should this be necessary. It is not vital however, and wires may be soldered directly to the boards for a more permanent

connection.

The prototype input board was fitted into the same box as the output board shown in Part two

of the series. Diagram Se shows the connections to the switches and phone sockets next to the computer reset switch. The two switches enable circuits 3 & 40 to the computer instead of an external power source, in the 'off position the imput circuit must supply its own power, but when 'or all you need its a write with a switch (or similar covid sensor) in circuit.

The other two circuits must have

a 6-12v power supply, since to run all four circuits off the 9v supply might overload it. The inputs are polarity conscious so you must ensure that the power supply is connected correctly (positive to the contact marked +1).

Testing the board

Connect the board to the computer, then power up. If the

computer does not power up as normal then switch off immediately and check the board for solder bridges or mistakes in the construction.

Assuming all is well, type in the following short program and run it (84 only – Vic details or

5 POKE 56576, PEEK(56576) AND 247: REM SET SERIAL ATN LOW 10 POKE 56579, 15: POKE

20 PRINT "-CLR." 30 X = PEEK (56577) AND 240: IF X = 0 THEN 30

IF X = 0 THEN 30
40 PRINT"-HOMR."; X: POKE
56576, PEEK(56576) OR 8
50 POKE 56576, PEEK(56576)
AND 247: GOTO 30

When you generate an input, in the form of a voltage between the Ov connection and one of the input lines, then the computer should print a number on the screen. This will be 16, 33, 64 or 128 depending on which input is activated. Test each input in turn to ensure they all work correctly. The POKE in line 50 provides the test function to clear the latch

after the input has been read.

Note that the SERIAL ATN line is being used to reset the latch.

Since this is also used by devices on the serial port you must.

POKE SESTS, PEEK(SESTS) AND 24T after every serial port access (not forgetting to set the bit before accessing the serial port or you will get a DEVICE NOT?

PRESENT error). It follows that no inputs can be read while a device is accessing the serial port (printer or disk drive etc.)

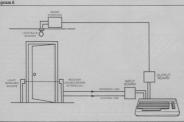

Making your system work

Like most of the projects the use is only limited by your imagination. Diagram 6 shows a system, which automatically someone enters the room, then turns it off again when they leave. You will note that you need sensors (switches) which inform the computer that an action has occured which needs a response. The computer checks what the response should be, in this case turning the light on or off, and then sends a signal to the relevant output channel. The sensor in this case could be a double 'interrupted beam' switch which (with suitable decoding) could tell the difference between someone entering or leaving the room. The computer would need to keep a count of the total people in the room and only switch off the light when the last person left.

For this sort of application the DIL switches on the input board

SWS 97- SK1

SWS 9

Loject ould be set to the OFF position, since we have an occasional signal which must always be

If you were using the computer as a burglar alarm, as shown in diagram 7, then you only want to know when the alarm is first triggered. In this case set the DIL Because the input channels are totally independent, you can have both types of input on the same

appropriate DIL switch. If you've been following the series so far, you will now be able to build a 4 input, 8 output system to control or mo many of the functions of your These devices can just as easily be used to operate a small robot, control a model railway - or itest let your imagination run wild. It's this ability to make a decision. based on the program 'facts', that makes computer control so much more versatile than just a straight relay wired to a switch. There's no room here for a sample program, but one that acts as a burglar alarm and house

VIC-REL - a commercial unit

manager' is available to you free from Commodore User on

For those of you without the facilities to construct boards. VIC-REL provides a simple and convenient way to interface the outside world to your computer, costing £34.95. Although not as sophisticated as the constructional projects it can be used to good effect in conjunction with the mains interface unit or for low-power control. The unit consists of a standard Vic-20 size cartridge

front and back. The front connector plugs into the User while the back connector is a connecting the wires. Included

Outputs

The six output channels are just relay connections. When the computer activates the channel the relay contacts close completing a circuit. This means an external source such as a transformer or batteries. The relay contacts are only rated at 24v dc and a 250mA current control any devices, you need appropriate voltage and current rating. The manual does explain all this, but does it at the back. I would rather have seen this at Diagram 7

manual fully before 'having a go' lights which indicate when the relay contacts are closed on each of the channels. This is a useful indication that the computer is the relay. If you want to use VIC-REL to operate the mains interface described in Part one of the series (Commodore User. September issue) then you can use the 5v output from the cartridge to operate up to 5 because the mains interface uses negative logic you must reverse manual (ie turning the VIC-REL channel 'on' will turn the mains

notorious for not reading the

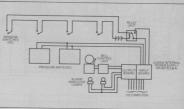

Sv and 12v; including the power

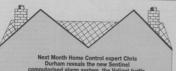

circuit 'off').

operated by any voltage between

output from the cartridge. Both the computer so there is no danger of damaging the computer even if there is a fault on the input lines. The user port register is read with a PEER command to see if either of the lines are set, but there is no latch; if a signal appears on the input briefly between two PEEKs channel must actually be 'on' when the computer reads it.

There are two LED indicators green this time, so that you can again check that the system is working correctly. One point that input channels also work on negative logic; when 5-12v is applied to the channel, the green LED lights up, but the 'bit' in the a l in the bit indicates a nosignal condition. Unfortunately numbers completely mixed up been amended). Input 1 gives a value of 128 and input 2 gives a

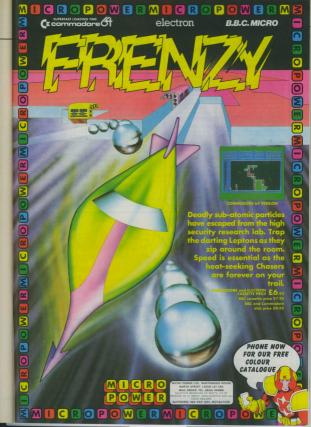

computerised alarm system, the Valiant turtle, and news of a specially commissioned Home Control listing that you can write in for.

value of 64, not the other way round as printed.

Conclusions

All in all, for £34.95 I found VIC-REL to be reasonable value for money. It does the job it is intended for, albeit without frills, and allows the nonconstructor to play around with controlling external devices with a minimum of effort. Although you cannot control anything really useful without at least adding another power supply and some relays, it does whet the appetite and show that computers do not have to be limited to games playing and letter writing.

A FREE LIGHTPEN!

Yes a FREE Light Pen! with every GRAPHKIT! Graphkit is the ultimate in drawing!, designing! or painting! (using the light pen of course, which incidentally has a full 3 year warranty!) Graphkit will amongst other things allow you to:

 Draw free handed on the screen anything from a Micky Mouse to your latest integrated circuit! With all the fill colour and erase facilities of course!

· Save/load your latest master piece to/from the disk/tape drive Or directly copy the drawing on the screen to the

printer! And keep it for ever or send to a friend as a post card! Design your own colourful sprites and characters

· Play the games in the packagel or use the light pen in your own games/education/programs

GRAPHKIT is available on disk and tape. Tape version is £1595 and disk version (recommended) is

All you 1540/1541 disk users DMON! Is here at last. Dmon is the disk monitor you have been waiting for it will • read/write blocks from/to the disk

display and edit blocks on the screen

display and send disk messages/commands

• transfer your programs from tape to disk or disk to disk or even disk to tape! • and more!

DMON comes on DISK at only £9.95

Do you use tapes? Are you sick and tired of waiting tape? Then you need a TORNADO!! Tornado allows you to Save/Load/Verify your Basic/machine code programs faster than a CBM 1541 disk drive does! Due to popular demand! Tornado now comes with new and more powerful commands plus extra instructions to assist you in making fast versions of your existing machine code/Basic programs. Tornado is available on tape for CBM 64 and 8K + programs.

Do your Run/Stop and Restore keys often fail? Do you want to come out of those crashes?! Or get into those unbreakable programs?! Then what are you waiting for, get yourself a BREAKER!! Reset switch and let your computer know who is the boss!! Breaker can be connected to your machine in seconds, no soldering. Included with the Breaker is a copy of basic recovery software on tape. Now available for any CBM 64 or Vic 20.

Commodore's 1520 printer/ plotter reviewed

by Chris Durham

The 1520 printer/plotter has been around for a while, but it's still the only plotting device that you can link easily to your Vic or 64. And the price is cheap too. It's gone down from £170 to £99.99, making it more of a tempting proposition for your Christmas stocking. But can a machine that uses ball pens and 4ins wide paper be capable of doing anything really useful? Chris Durham finds out.

Once upon a time, deep in the dungeons of Commodore Towers, there was a lot of plotting going on. Lots of multicoloured symbols appeared on long, narrow pieces of paper. No, this wasn't an early bid to oust the Chairman, but the Commodore boffins beavering away to produce yet another 'add-on' for their home computers. And so the 1520 was born, a combined printer and plotter, using four coloured ballpens (green, red, blue and black) mounted in a 'turret'. Commodore were not the first to produce such a device; others had beaten them to it for different machines, but Commodore saw the potential. For the first time, people buying a Vic or 64 could add on a device to give up to 80 column printing in colour, plus a drawing facility, at a price well below normal dot-matrix printers at the The 1520 is a small machine

Why a plotter?

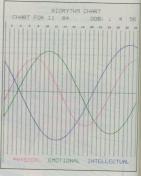

Until machines like the 1520 appeared on the market, plotters were large beasts used by major companies to produce maps.

diagrams and such like. Some smaller A3 plotters were available for business or scientific micros to draw stuff like graphs and charts, but these were still rather expensive. Home computer users were denied any sort of plotting facility unless they could write their own routines for a screen dump on to a dot-matrix printer; and even then it was strictly black and white. The breakthrough came with

the sudden increase in computer ownership; at last there were enough people around who might just want a cheap machine that could draw lines and do printing, all in the same package. Suddenly, home computer users equations, draw pretty pictures and generally do all the things they never even knew they had

1520 - the machine

neasuring only 11ins wide by about 6ins deep, without the paper roll. This roll sits in the cradle at the back, rather like a life-boat between davits, and adds another 3ins to the depth There is a removable cover on the top of the printer to allow access to the pen turret and to allow paper to be fed round the

e great

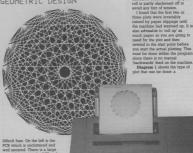

roller. The cover has a serrated 'tear-bar' included where the paper emerges, but while it doe the job, the act of pulling the paper against it also tends to pull the paper through the rollers. The result, unless you are very careful, is a diagonal tear rather than a straight one - this is a minor niggle though, rather than

There are three controls on the front edge, plus the power-on indicator. The controls are (from the left) paper feed, colour change and pen change. The last remove the pens from the turret, one pen at a time. When changing pens the turret moves to the extreme right-hand side of the carriage where there is a neat little bar that flicks the pen out of its holder. You then press the colour change button; the turret moves back to the lefthand side, changes the pen colour, then moves to the right for you to remove the next pen. and so on for all four - very nest.

It is recommended that you remove the pens and cap them when not in use; they are so small that they tend to dry out very quickly if left inside the plotter all the time. One complaint about the pens is the price: you have to buy a complete set of four pens at £S a set, but it is often only the black pen that has run out of ink.

The internals of the machine are neat and well laid out. The print head and paper feed top-half of the case, connected by two sets of cables; one set transformer is mounted inside the lower-half of the case on the right with a power switch and a

GEOMETRIC DESIGN

heatsink between the PCB and the power unit and good get very hot even when left on for long periods.

The 1520 as a plotter

At the current price of under £100 you can't expect miracles 1820 is capable of plotting almost any type of graph that can be expressed either mathematically or as a series of co-ordinate move anywhere within the plot boundary relative to a fixed starting point, or relative to a temporary point (for example the last point plotted). The pen and the paper is moved up and down in the Y-axis: both can

Colour is changed by rotating the turnet so that the new pen is old pen; the turret in fact moves off the plot to change pens and then moves back to the original

Because the paper is fed up rollers pressing against the rubber platten, the paper can slip if there is any pull on it at all The original 1520s had a cover over the paper, but this was later removed; I suspect because the paper would hit it and alter position when fed back. Even without this cover, you must be

example programs in the manual (which contained a major error as printed!). There are many similar designs which can be drawn very easily. You can even try out your own 'pattern maker' different colours. You can plot dotted lines of varying ratios and even 'fill in' areas with colour, although since this must be done one line at a time it is rather laborious. Once you start using a plotter, you begin to find more and more uses for it as you become familiar with its capabilities.

careful to ensure that the paper

omputer

Changing the device number

One of the most bemoaned features of the 1820 is that Commodore configured it as device '6', rather than the normal device number for printers which is '4'. The result is that there is a large amount of software which will not work with the 1520 as a

Going for device 6 was supposed to allow both a normal printer and a plotter to be connected at the same time. However, Commodore do not fit a second serial port on any of their printers; unless you make your own splitter box there is no way you can connect two printing devices simultaneously! Fear not though, help is here

Removing the PCB reveals the method of changing the device two screws on the bottom front edge of the plotter and carefully lift off the top part of the case, disengage the lugs at the rear before you dive in with your Then undo the screws holding the PCB in place, including those holding the heatsink (do not undo the bolts connnecting the Now turn the PCB over and find three half-moon shaped pads, as shown in diagram 2, just to the right of centre (holding the board so that you can read the printing

at the top). The two outer pads are connected and the centre one is not. To change the device number to '4', solder a short piece of wire from the centre pad to the track immediately above it (ie as the other two pads). If you wish to be able to easily then you can solder a wire to the track, a wire to the pad and connect both wires to a switch. With the switch 'off' you will have device '6', and by

The 1520 as a printer

Having shown you how to reconfigure the 1520 as a standard printer, what sort of it? The first thing to say is that Secondly, if you use the 80 column mode you shouldn't give with less than perfect vision; it's rather small. Lastly, you cannot obtain the Commodore graphics you get is underlined alphabetic characters if you try. Having said all that, if all you want to do is list programs, make notes or write processor then the 1520 is

Diagram 3 shows the four different print sizes which can be used and these can be put to good effect when mixing text as diagrams. Text can also be rotated to the right by 90 degrees; by combining this with different order you can orientate the text in a number of different

ways. This is ideal for jobs like Providing you took care over wordprocessor, leaving a suitable gap in the text, then go back and plot a graph in the gap, using a separate program. The one disadvantage is that most

wordprocessors will be unable to change any of the parameters of the printer such as text size, unless they have been specifically written for use with

The manual

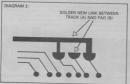

Like all Commodore manuals, the manual is a mixture of good and bad. It is fairly logically laid out There are examples of virtually

lines which talks about absolute origin points and relative origin points is a little confusing. The bad point is that some of the more complicated example programs at the rear of the manual contain errors which send the plotter all over the place. Line 220 in the Geometric Design on page 83 for example should read L*COS and not L* SIN. Silly errors like this should really be caught at the proof reading stage. Apart from the errors, though, it is a useful manual and provides plenty of

The 1520 printer plotter is a neat compact little machine which nicely fills in a hole in it is rather limited except for personal use and there are other small printers about

around the same price However, if you have any need at all for a plotting facility then I regard this as good value at under £100. It is a fun machine and if you like the idea of the new MCS 801 colour printer from Commodore, but can't afford £400 then the 1520 is a consolation prize to do similar things in miniature. For those who already have a 1520, Chris Durham has produced a program to let you plot your Biorhythms - it's in

the Victuals section of this

MusiCalc

MAKES THE 64 MAKE MUSIC

CREATIVE MUSIC

MusiCalc turns your Commodore 64 into a sophisticated musical instrument. And it turns you into a composer, performer and conductor

MusiCalc 1's Synthesiser and Sequencer is the heart of the system. With it you can use your computer keyboard to program the tempo, key and style of music you want, and also to play your favourite time. The computer screen will show you what the music's doing as you play and how to control as

MusiCalc's preset scores. Try combining that with a preset sound you like. Choose the scale you want to play in – anything from jazz to

Japanese.

And you've got music.

Exercise your musical creativity
by putting the three voices together
any way you want, and play
whichever parts you'd like. Make
changes and add special flourishes

Even a musical novice will sound good right away. And the greater your musical talent, the more challenging and exciting MusiCalc becomes.

And the result is not mere imitation of conventional instruments: between them, MusiCalc and the Commodore 64 can and should perform as a sincle musical tool in their own right.

There are things that you can do with that tool which would be impossible on anything less than an expensive professional synthesiser: MusiCalc's music is its own.

PROFESSIONAL QUALITY

A professional synth user would immediately recognise the concept

It is sufficiently simple, sane and sound for use by the inexperienced hobbyist and it is sufficiently rich and complex for use by non-

- Those facilities include: a control panel with 'slider'
- switches
 waveform selection for each
- voice
- ADSR envelope controls each voice
- gate synchronisation controls
 ring modulator controls
 pitch transposers
- fliter controls, include low and high-pass bands
- tempo and volume contro
- a score display for composition via notes and octaves
- built-in ready-to-go tunes to play or edit
 the ability to save further scores
- scales

This means with MusiCalc you can ...

- compose and edit music
 play it in a variety of different
 ways (with different time
 signatures, simulating different
 instruments. etc)
 - save a tune and subsequently reload it to play or edit.

MAIL ORDER FORM

How to teach your Micro a thing or two

Thousands of home computer owners have yet to discover their microcomputer's potential to help with many of the problems and decisions that come up every day in the home or office. Perhans you have always promised yourself that

you would teach yourself programming, but have been you would teach yourself programming, but have been you would be to seem to assume a lifetime sport of manuals which seem to assume a lifetime sport of manuals which seem to assume a lifetime sport of manuals which seem to assume a lifetime sport of manuals which seem to the computer books, but have yet to find one which is free of unnecessary jargon or where the program examples bear some relevance to real life and not space invaders.

Relax, your search is over.

The 'Learn BASIC' tutorials from Logic 3 are the latest development of a teaching method pioneered by Professor Andrew Colin and perfected by testing on 3 generations of students at Strathclyde University. The 'Strathclyde Method' has been translated into 8 languages and used by over 300,000 microcomputer users.

'Learn BASIC' is a jargon free, step by step, course in computer programming, which explains everything clearly in English, not computer talk. In a matter of hours you will be writing your first programs.

'Learn BASIC' is designed for people who want to keep abreast of the computer age, for people who realise that understanding computers is a key to future success at work, at school, and as a parent.

Get 'Learn BASIC' and teach your micro how to be useful! (Available from major branches of W.H. Smiths, Boots, Laskys, Greens, John Menzies and better computer shops nationwide.)

Make new friends,

With Mirrorsoft games, you can make loads of new friends like Mr. Bounce and Ceasar the Cat. Or, now, like Dr. Frankenstein, you can create your very own monsters and aliens. As well as friends and heroes to defeat them.

GAMES CREATOR Invent your own games. As simple or as

complex as you care to make them. The only real limit is your imagnation.

For the CBM64, the Games Creator comes with a step by step manual and three ready-to-play games. Each demonstrates some of the programs exceptional features: shapes, movement, speed, scrolling backgrounds, scoring, music, sound effects and many more. And you don't need to know any program language to work it.

ow any program language to work it.

On fast loading cassette for the CBM64. £12.95.

STAR EGGS A space fantasy. Earth is threatened by attack

from Alien life-forms hatching out in space. You must first overcome the Guardians. Then into the Hatchery up and down escalators and ladders to crack the eggs before the aliens escape. On fast loading cassette for the CBM64, £695

CATASTROPHES

Use a helicopter to build a hotel on an island paradise. But you have to move fast and design your building carefully because earthquakes, floods, storms and lightning can strike at any moment. For one or two players. On fast loading

and enemies.

HI-BOUNCER

An arcade type game featuring Mr. Bounce and the Mr. Men. But don't get the idea that it's just a kids' game. Far from it. There are four main screens each with eight levels of difficulty and complexity. Don't worry, there's also a practice program with slower speeds. On cassette for the BBC B £6.95.

CEASAR THE CAT

Ceasar's cute and quick. Help him hunt the crowded shelves for mice who eat all the food. Hemust catch the mice before the food disappear Outstanding graphics, arrimation and sound. On cassette for the CBM64, Spectrum 48K, BBC B. £69.

WIRKORSOFT

SOFTWARE FOR ALL THE FAMILY
Available from Boots, W.H. Smith, Spectrum and all

good software stockists. Write for a free catalogue to: Mirrorsoft, Holborn Circus, London, FCIP 100

Your own characters The Easy Way. by George and William Pike.

'Vaders, zombies, greenies, munchies: bombs, bullets, mines and missiles. The armchair critics tell us we can have any graphics we want on Commodore computers, providing we want Clubs, Diamonds, Hearts or Spades: not true! not true! Design the characters you want and put them in your programs. No fuss, no sweat, no hassle: here's how. For both Vic and 64.

	Vic-20	CE
Set 1: normal:	32768	5324
Set 1: reversed:	33792	5427
Set 2: normal:	34816	5529
Set 2: reversed:	35840	5632

copied. For example, try FOR I=

Programs usually need at least 170

110 FOR I = 8 TO 727 + D: NEXT

FOR I = 8 TO 263. Line 120 is

122 FOR I = 352 TO 727

Table 1: A Starter Program

FOR J = 0 TO 23: READ A POKE 6144+J, A: NEXT POKE 13312+J, A: NEXT POKE 36869, 23

The last three lines are the same for both

DATA 24,60,60,24,255,255,66,66 DATA 60,60,24,60,126,255,66,195

DATA 0,16,248,28,31,28,248,16

Being too fusey can mean the extra lines needed use up more extra lines needed use up more hearts from the state of the characters left out. Please yourself: the possibilities are endiess. Table 2 has the start and finish numbers for each finish character in the group. The property of the first character in the group.

Now to define our own characters

Line 110 I Values

This is simple. Table 3 gives three examples. Each character is designed on an 8 x 8 grid any key we choose - on the computer. This is done in Line 140.

As it stands, Line 140 puts the three characters into reversed (%/K and 5: That means if you type RVS (6' or POKE 129 into a location, New Character I will appear on the screen. Similarly RVS '4' and POKE 130, or RVS '8' and POKE 131, will produce

respectively the second and third characters. It is not always convenient to use reversed characters in a program. Fortunately there are alternatives. For example, we can

Line 110 I Values

set the computer up:

To copy the text characters out of ROM into RAM To put the defined characters into RAM:

To put the defined char The last lines are the same for both computers

(square) of squares. Simply shade in squares on the grid until the character you want is cobtained—an eraser is a must obtained—an eraser is a must (All the 'switch-on' characters on the computer were designed in this way; this can be seen quite clearly by a close look at a large-screen Vic.)

Once the required shape is Ground, all that is needed is a simple addition for each line on the grid; ris just a binary-to-decimal conversion. The sums for the characters on Table 3 are shown on Table 3. The answer for that time to go in lines 180-170—that time to go in lines 180-170—on Table 9. The that time is the DATA value of that time is 190-170. The time of time

program has a separate line of DATA for each character. That's recommended but the DATA tense can follow on, on the same line until the line is full. There must be eight DATA values for each and every character to be designed.

Line 130 will be FOR J = 0 TO.

X. where X is less than eight

X, where X is less than eight times the number of characters being defined - hence 23 in the Starter Program, for three characters.

How do we 'work' our character? Each defined character must be assigned to a particular key put the characters into strings. A line to do this might be:

180 A\$ = "[RVS ON] @ [RVS OFF]": B\$ = "[RVS ON] A [RVS OFF]": C\$ = "[RVS ON] B [RVS OFF]":

This is not a lot better. An alternative is to assign them to keys whose characters have not been copied. If they have in fact been copied, our defined characters will win', it will replace the character previously copied from ROM.

It is helpful to assign them to

keys which follow such other in the POKE list, Table 2, and the POKE list, Table 2, and the keyboard. The four graphics character keys at the end of the POKE list fit be bill - the ones you get when you hold the Commodore and Still'T keys. POKE 124, 126, and still respectively are the numbers you need.

DOKE 124, 126, 126 and 127.

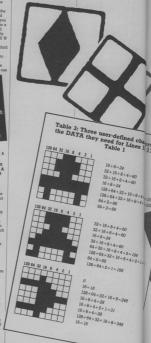

POKE 124, 126, 126 and 127.

**Unfortunately the "C" and "X"

Unfortunately the 'C' and 'X' are the 'wrong way round'; but we can put up with this. If we choose to put our three characters on to CBMSHIFT 'C', 'X' and 'V', we must change line 140:

140 POKE char + J.A: NEXT

where char is 6112 for the Vic.
or 13380 for the 64 - 6112 is 5130
+ 992: 13380 is 12388 + 992: 992
is the starting or From' number
of the character at 124, CBM
SRIFT C - the first of our three

part of RAM as our copied

And now it's up to you

The characters are defined and copied. The time has come actually to write a program. Use the copied and defined characters as you wish; there are

Once the characters are it is well worthwhile to write the main program first; that saves

It will look a bit odd if your Eekon or whatever is a black

going to be when you RUN, so

Then you can use a GOSUB or GOTO or merge in some

Line 110 1Values

haracers and

The "Expert Menu" adds a variety of computer automated others. A "Files Menu" allows the user to save pictures and

FOR THE CBM 64

Until now, creating computer graphics in colour has been both a demanding and expensive endeavour. The "Super Sketch" Graphics Tablet provides a totally unique and simple

medium for creating video graphics at a surprisingly low cost. By simply moving the stylus control arm, as you would a pencil, Super Sketch reproduces the movement on the video screen. Four control buttons at the top of the tablet assist in operating the graphic functions of the software. Graphics may be created by "free hand" or by "tracing" from drawings

clipped to the pad. Compared with other computer graphic products, it is much easirer to use than keyboard controls, does more than joysticks, paddle controllers and mouse controllers, and is less expensive than touch pad products.

Comes Complete In One Package

Included in each package is all you need to create super graphics. A software cartridge is included in each page on the package). Also included is a comprehensive instruction manual and a "Starter Kit" that consists of

Dear Tommy, I am at the end of my tether. It seems that I am totally unable to get an ansfrom Commodore to my

I have a Vic-20 and a Brother CE80 Electronic Daisywheel Typewriter plus its IF50

interface and its CA50-5 cable set (the machine accepts RS232 or Centronics). The lead has a 'D' 25 pin plug which the Vic-20 does not. How do I use the Vic-20 in RS232 to drive my word processing equipment? I have Vicwriter and Disk Unit. Why don't Commodore tell us more about the RS232 ability of the

Vic-20, or is it all a filthy lie? Please don't throw up your hands - please help me One of the most common problems

I get asked about is how to connect two different manufacturers' equipment together so that they work as expected. The most pertinent piece of advice I can give is do not buy any equipment made by

that the equipment is compatible

b) without making it a condition of sale that equipment X must be capable of working with computer Y when used with interface Z.

Failure to do either will almost certainly ensure that you are going to have problems at some stage. Even the so-called 'standard' RS232 interface has a number of variations, any one of which can prevent the two pieces of equipment from working straight away. Having

Many of the programs published in the magazine will give you an idea of using hi-res modes, but the easiest way is by using the Super Expander Cartridge from Commo ting commands directly from Basic

1. Standard 22 col text and/or Commodore graphics (low-

3. Multi-colour graphics mode

2. Hi-res graphics mode

The function keys also do not have any real use without going into machine code programming unless you buy one of the cartridges which allow them to be set to pre-set strings, such as the Programmers Aid cartridge. They can of course be 'read' like any other key with a GET AS, which will return a value between 133 and

Lastly, the CBM key is used in conjunction with the SHIFT key to change between upper and lower case letters plus restricted graphics set. It is also used as a 'control' key by a number of applications programs such as word processors. If you wish to test if it has been pressed during a program then address 653 will contain the value 2 while the CBM key is actually being pressed (or 3 if the SHIFT key is pressed at the same

The function keys also do not have any real use without going into machine code programming unless you buy one of the cartridges which allow them to be set to pre-set strings, such as the Programmers Aid cartridge. They can of course be 'read' like any other key with a GET AS, which

Lastly, the CBM key is used in conjunction with the SHIFT key to change between upper and lower case letters plus restricted graphics set. It is also used as a 'control' key by a number of applications programs such as word processors. If you wish to test if it has been pressed during a prothe value 2 while the CBM key is actually being pressed (or 3 if the SHIFT key is pressed at the same

Dear Tommy, Please tell me how to make eight different sprite characters appear on the TV screen, at once. Every time I try, I get duplicate copies of the first sprite's data, the computer won't 'read' the cond. third, etc. chunks of

I use a 'sprite builder' tape by Euro-Byte; could this have something to do with my

Also is it possible to create more than eight sprites?

What you have to do after creating your sprites is to tell the computer where to find the information. The Sprite Data Pointers are the registers you need to set and these are at addresses 2040-2047. Each of these addresses must be set to the location of the first byte of data for your sprite; for example, if the data for sprite 0 is held from 12288 to 12350 then POKE 2040,192 will set the data pointer (12288/64 = 192).

The next sprite will be stored from 12352 to 12414 and its pointer will be set by POKE 2041,193, and so on... What has happened in your case is that you appear to have set all the sprite data pointers to the same sprites; whether this is caused by the Euro-Byte program I have no idea since I haven't seen that one. If when you set up the difoccurs when you transfer the data to find out where the sprite information is being stored in memory and set the data pointers accordingly. As for creating more than eight sprites, you can store the data on as many as you like (memory permitting) although the data must be in the same 16K 'page' of memory as the screen area. The limitation is that without using machine code and interrupts you cannot display more than eight at a time since there are only eight sprite data pointers

Dear Tommy, I have a few mestions concerning Commodore's 1520 printer plotter. Can the printer print

user-defined graphics? If so, how can this be done? Is it possible to print the Vic-20's character set? If so, how can it processor supports the 1520? (if any!). Thank you.

The 1520 printer/plotter can only does not mean that you cannot send down the codes to actually draw the characters you require. these en-masse to the plotter for printing later on in the program; to design your characters on paper, working out the plotter These can then be stored (on disk or tape) and loaded into a multi-dimensional array for each programthen require a sub-routine which particular character to the plotter as a series of co-ordinates to be plotted.

I assume your second question refers to the Commodore graphics characters, in which case the answer is no; these characters are not included in the ROM based character set. If you try to print control codes for example, you will merely get underlined characters (pages 42/43 of the plotter manual refer to

Finally I do not know of any 1520. One of the reasons for this is set up as device 4 on the serial bus, whereas the plotter is set up as device 6. Any normal command to by the plotter. I am afraid that if you want to use a WP program you will have to invest in a standard printer.

Dear Tommy, Can you tell me. please, whether a Commodore 64 made for the U.S. market can be used in this country? I bought a Commodore 64 in Seattle, and brought it back here; that it won't work with a discovered, but would there be any problem with a colour computer monitor? Any help with this would be greatly appreciated, as I would prefer not to have to buy a whole new computer! Some method Anirog (which produce very whereby I could interface my 64 with a U.K. monitor would be ideal. Also, could I use cartridges with my US

I am afraid that you have more than start the power supply transformer

existing transformer otherwise you purchase a new power supply, al-

convert 240v to 115v

Even then you have a second problem of timing. The US machines use a 60Hz timing signal. UK machines use 50Hz. This means problem for most applications timing application. There is no reason why a colour monitor will the pinch roller and upset the tape difference. Finally, cartridges are universal and will run quite happily overcome the more fundamental

Dear Tommy. I have one or two sestions on the "health" of my Vic 20 and Datassette. The power transformer heats up uite a lot. Is any damage ossible from this overheating? Will my Vic be damaged in any way when the power

transformer gets hot? When a program has been loaded and the wheels stop urning round, but "play" utton is still down, is any damage done to the Datass

Now I have been having some more trouble with my Datassette or Vic. Only some programs load. Cartridges work, though. For example, Chariot Race (Micro Antics) and Tank Commander

(Creative Sparks) won't load. but Charlot Race sometimes will load, but this is very rare. All Anirog games and LLamasoft games will load, every time. That goes for Tornado (QS) too. Why is this so? I've cleared the "heads" on my Datassette. I tried Tank Commander in the shop and at a friend's house. It worked then. Now I don't feel I can go out and buy a game, in case it won't load. Unless it's by

good games actually). Finally, can all programs needing 8k expansion use 16k expansion? And could you tell me where the screen codes and screen colour codes begin and end on a 16k expanded Vic.

The simple answer to your damage transformer gets too hot to touch which case you should return it to your dealer for checking. If it is not and no damage will occur. You should always ensure that you unplug it when you have finished with the computer though and not leave time; this can eventually cause it to

The PLAY button on the cassette recorder can stay down without damage since the computer will turn the motor on and off as required. You should not leave the sachine in this state when you have finished using it however, since this will cause distortion of speed

You don't say how old your cassette is. I know of a number of people who have similar problems with the 'old-style' cassette. If yours is fairly new, then it could be the tape head alignment. If the programs you have saved yourself all cial ones don't, then see if your dealer will check out the head alignment and tape speed for you. Finally, all programs that need

8k should run without problem using 16k; the screen and colour maps relocating at 4096-4607 and 37888-38399 respectively.

Dear Tommy, The other day I set about composing a program which had a timing element within it. I wanted the time to be shown to 2 decimal points. ie. hundredths of a second. The following program is basically

what I need-10 PRINT"(CLR)" 20 T=0 30 PRINT"(HOME)"T 40 T-T 0.01 SO GOTO 30

On running the above program you can see the problem that I encountered. Please could you explain why this occurs, and how to remedy it.

You are suffering from a common mat there is a limit to the size of fraction that can be held accuor lower. The way to overcome the

30 PRINT"-HOME-"T/100 40 T=T+1

Dear Tommy, Could you please tell me a little about integers and how they work as I don't know how, where and when to use them. I own a Vic-20. Thank you.

Basically, 'integers' is just another means numbers without any fracteger if required. If you have a number which has a fractional part, the answer 2. As to how, when and where, it really depends on what

If you store numbers in integer you are in fact wasting time since time you access the variable. However, an integer variable only occupies 2 bytes, whereas a floating point number occupies 5 bytes. a program into an unexpanded Vic-20 then using integer variables whenever possible will save space especially in array declarations. DIM A%(5,5,5) takes 250 bytes. DIM A(5,5,5) takes 625 bytes! If memory size is not a problem then

You are also limited to the values -32768 to +32767 in an integer ing point variable can store a much

larger number

Another use for integers is checking whether you have reached a certain multiple, within a loop for example. The following short piece of code will print 4 numbers across the screen before going on to the next row. It uses the by the same number you divided by, you only get the same number when it can be divided an exact number of times. Try running this

10 FOR A=1 TO 16
